- The 1996 Downstream Passage Smolt Study (Normandeau Associates, Inc.) – This study included a mixture of hatchery and wild sources of fish. Of the 49 released fish, 61% passed the project via the powerhouse (77%), the fish bypass (13%), the Pawtucket Canal (7%), and an unknown route (3%). Of the fish that passed the project, hatchery fish took approximately 100 hours to pass and wild fish took about 28 hours.
- From 1999 through 2001, the Licensee performed yearly internal fish lift efficiency studies. Table 5.4-3 in the Pre-Application Document does not clearly describe the chronology, the purpose, and results of these studies. The Licensee should be consistent by only using the publication date to avoid confusion. Each study tested a specific component or modification these tests need more clarification.
- The 2002 USFWS Study – no comments.
- The 2003 Downstream Passage and Smolt Survival Study (Normandeau Associates, Inc.) – The Licensee studied three fish bypass flows (2%, 3.5%, and 4.5% station discharge) with 20 tagged smolts each. Bypass efficiency improved with increased flow, though none of the tests resulted in adequate passage efficiency. Cumulatively, 59% went through the turbines, 32% went through the bypass, and 9% were undetermined. Turbine survival was very high, but predation in the tailrace was also extremely high. We consider tailrace predation a project effect. Turbine passage and other designated downstream passage routes that concentrate the migration into a small area provide predators unfettered access to easy prey. Without the project, dispersal of prey would result in decreased predatory efficiency.
- The 2011 Upstream Three-Dimensional Study (Alden Research Laboratory, Inc. – no comments.
- The 2013 Upstream Three-Dimensional Study Further Analysis (Blue Leaf Environmental) – The study showed that greater than 80% of the detections of tagged shad were between the elevations of 40 and 50 feet suggesting that fishway entrance efficiency would dramatically improve by lowering the invert of the entrance and maintaining the entrance jet velocity.
- The Licensee should include a description of the 1990 Normandeau Associates study entitled, “An assessment of the effectiveness of a fish bypass for passing downstream migrating Atlantic salmon smolts and estimated survival of salmon smolts passed through the 8.6-MW Kaplan Turbines at the E.L. Field Hydroelectric Project, Lowell, Massachusetts”.
- The Licensee should include a description of the 2016 study entitled, “Analysis of Upstream Fish Passage Facilities and Operation”.

5 REQUESTED STUDIES

Our study requests intend to facilitate the collection of information necessary to conduct effects analyses; develop reasonable and prudent conservation measures; and protection, mitigation, and enhancement measures pursuant to the Fish and Wildlife Coordination Act, as amended (16 U.S.C. §661 *et seq.),* and the Federal Power Act (16 U.S.C. §791a, *et seq.).*

5.1 REQUESTED STUDY #1: AMERICAN EEL PASSAGE DOWNSTREAM STUDY

The Merrimack River is a migratory corridor for American eel. This species must be able to pass the project without undue harm or delay to complete their life cycle. Poor passage at the project limits access to spawning habitats in the Sargasso Sea harming genetic diversity and resilience within the population. The Lowell project includes potential emigration routes over the Pawtucket Dam, through the E.L. Field Powerhouse turbines, over the E.L. Field Powerhouse fish bypass, and through the Pawtucket Canal including multiple dams and powerhouses. The Licensee is installing a pneumatic crest gate at the dam that decreases leakage through the flashboards and provides more control of spill over the dam. We request a study to determine the downstream passage routes at multiple river flows and operating conditions to inform safe, timely, and effective passage measures at the project.

GOALS AND OBJECTIVES

The goal of this study is to determine the impact of the Lowell hydroelectric project on the emigration of silver eels in the Merrimack River. Project operations can result in delay, mortality or injury during emigration. We need to understand the extent of delay, the passage routes, and the potential for mortality to determine measures and recommendations to increase survival and improve fish passage at the project.

The objectives of this study are:

- Quantify the movement rates and delay caused by multiple river flows and project operations
- Quantify the relative proportion of eels passing each emigration route at the project during multiple river flows and various project operations.
- Quantify instantaneous and latent mortality of eels passed via each emigration route.

RESOURCE MANAGEMENT GOALS

The ASMFC has developed five documents related to the management of American eel including:

- Interstate Fishery Management Plan for American Eel. April 2000. Atlantic States Marine Fisheries Commission.
- Addendum II to the Fishery Management Plan for American Eel. Atlantic States Marine Fisheries Commission. Approved October 23, 2008. 8 pp.

Objectives of the fishery management plan include:

(1) protect and enhance American eel abundance in all watersheds where eel now occur; and

(2) where practical, restore American eel to those waters where they had historical abundance, but may now be absent, by providing access to inland waters for glass eel, elvers, and yellow eel, and adequate escapement to the ocean for pre- spawning adult eel.

Addendum II contains specific recommendations for improving upstream and downstream passage of American eel, including requesting that member states and jurisdictions seek special consideration for American eel in the Federal Energy Regulatory Commission relicensing process.

The American eel population is severely depressed in the Merrimack River watershed. Our goal is to restore American eel to historical habitats and ensure safe migratory pathways to build abundance and resilience in the population.

PUBLIC INTEREST

The requestor, NMFS, is a federal resource agency.

EXISTING INFORMATION AND NEED FOR ADDITIONAL INFORMATION

Upstream of the Lowell Hydroelectric Project is the Merrimack Project (FERC No. 1893) which has been conducting ongoing silver eel downstream passage studies. In 2017, the Licensee installed receivers at the Lowell project to continue the monitoring of the tagged eels that passed the Merrimack Project (Normandeau Associates 2018). The study detected fourteen eels near the Lowell Project with eight going through the turbines, five passing over the spillway, and one undetermined route. One of the eels that passed through the E.L. Field Powerhouse died. The study did not monitor the Pawtucket Canal or the downtown project facilities. Throughout the study, the canal system was not operating though there was sufficient river flow to operate. Therefore, the study lacks information regarding project effects in the canal system on silver eel emigration. In addition, the study has an insufficient sample size and does not have a control group or mobile tracking to account for drifting of dead eels.

PROJECT NEXUS

The Lowell Hydroelectric Project does not have entrainment prevention at any of the turbine intakes. Adult eels have an average mortality of 10.9% (±13.0 S.D.) passing through Francis turbines and an average mortality of 25.7% (±10.6 S.D.) passing through Kaplan turbines (Pracheil et al. 2016). E.L. Field Powerhouse has two Kaplan turbines and the canal system has 19 Francis turbines (12 still operate). Silver eels emigrate during the mid-summer through late fall (Haro 2003), a time of year when Merrimack River flows equal or exceed the operating capacity of the stations only part of the time. Therefore, we expect the project to spill infrequently during the silver eel emigration forcing eels to pass through the canal system, the E.L. Field Powerhouse, or the fish bypass. We assume entrained eel at the project powerhouses will incur unacceptable levels of mortality. We base this assumption on published mortality statistics, the age and specifications of the turbines, the complexity of canal routing, and the likelihood that emigrating silver eels will have to pass two turbines to reach downstream of the project (upper canal and lower canal). Therefore, as a first step in understanding overall project mortality, we need to understand the routes of emigration and the potential for delay under different river flow conditions and project operations. This study will contribute to the development of an administrative record in support of potential Section 18 fishway prescriptions or 10(j) recommendations.

PROPOSED METHODOLOGY

This study should be conducted using radio telemetry, with a study design that specifies sample size and tag and receiver configurations. A statistically significant number of telemetered eels are necessary to establish a clear understanding of how project operations affect eel emigration. The Licensee should release groups of eels during spill and non-spill periods. The Licensee should operate the Pawtucket Canal system turbines during the study. The Licensee should record river flow and project operations throughout the study. Release of tagged eels should be a few kilometers (km) upstream of the Pawtucket Dam. The project design should include a smaller sample of dead eel to act as a control group, as fish can drift significant distances downstream after they have died (Havn et al. 2017). Telemetry receivers and antennas should be located above and below the project to assess passage. Receivers should monitor the following potential routes: entrance into Pawtucket Canal via the Guard Lock and Gates Facility, passage over the Pawtucket Dam, entrance into Northern Canal at Pawtucket Gatehouse, entrance into E.L. Field Powerhouse turbines, and entrance into the E.L. Field Powerhouse bypass.

Mobile tracking (i.e., via boat) in river reaches between release sites and several km downstream of E.L. Field Powerhouse should be performed at regular intervals during and after releases to confirm routes and fates of fish.

Movement rates (time between release and passage) of eels passing the projects by various routes should also be quantified using time-to-event analyses (Castro-Santos and Perry 2012).

This study will require two years of field data collection to account for inter-annual variability in river discharge and water temperatures.

LEVEL OF EFFORT AND COST

The level of cost and effort for the downstream eel passage study is moderate to high. We anticipate the study will require two migratory seasons to acquire enough data. The Licensee will need to purchase silver eels from a distributor with ample supply, as the Merrimack River does not have an adequate population to harvest. To use the acquired eels, the Licensee will need to permit the use of out-of-basin eels in the study. Each group of eels will require tagging and release over the course of each migration season representing seasonal flows and project operations. The Licensee will download the data periodically, analyze it, and report the results. We estimate the cost will be approximately $150,000 per year for the study. No alternatives are proposed.

5.2 REQUESTED STUDY #2: JUVENILE ALOSINE DOWNSTREAM STUDY

The Merrimack River is a migratory corridor for juvenile alosines. These species must be able to pass the project without undue harm or delay to complete their life cycle. Poor passage at the project limits access to marine habitats harming stock recruitment and resilience within the population and ecosystem benefits to other trophic levels. The Lowell project includes potential emigration routes over the Pawtucket Dam, through the E.L. Field Powerhouse turbines, over the E.L. Field Powerhouse fish bypass, and through the Pawtucket Canal including multiple dams and powerhouses. The Licensee is installing a pneumatic crest gate at the dam that decreases leakage through the flashboards and provides more control of spill over the dam. We request a study to determine the downstream passage routes at multiple river flows and operating conditions to inform safe, timely, and effective passage measures at the project.

GOALS AND OBJECTIVES

The goal of this study is to determine the impact of the Lowell Hydroelectric Project on the emigration of juvenile alosines in the Merrimack River. Project operations can result in delay, mortality or injury during emigration. We need to understand the extent of delay, the passage routes, and the potential for mortality to determine measures and recommendations to increase survival and improve fish passage at the project.

The objectives of this study are:

- Quantify the movement rates and delay caused by project operations
- Quantify the relative proportion of juvenile alosines passing each emigration route at the project during various project operations.
- Quantify instantaneous and latent mortality of juvenile alosines passed via each emigration route.

RESOURCE MANAGEMENT GOALS

The NMFS is a federal resource agency with a mandate to protect and conserve fishery resources and associated habitat. Regulatory statutes codify our resource management goals and plans. We rely on the best available data to support conservation recommendations and management decisions. Data sought in this study are not available. This study is an appropriate request for the pre-application period.

The ASMFC has developed six documents related to the management of alosines including:

- Interstate Fishery Management Plan for American Shad and River Herring. October 1985. Atlantic States Marine Fisheries Commission.
- Supplement to American Shad and River Herring Fishery Management Plan. October 1988. Atlantic States Marine Fisheries Commission.
- Amendment II to the Interstate Fishery Management Plan for Shad and River Herring (River Herring Management). May 2009. Atlantic States Marine Fisheries Commission.
- Amendment III to the Interstate Fishery Management Plan for shad and river herring (American Shad Management). February 2010. Atlantic States Marine Fisheries Commission.

Relevant objectives in the fishery management plans include:

(1) Improve habitat accessibility and quality in a manner consistent with appropriate management actions for non-anadromous fisheries.

   a. Improve or install fish passage facilities at dams and other obstacles preventing fish from reaching potential spawning areas

   b. Ensure that decisions on river flow allocation (e.g., hydroelectric operations) take into account flow needs for alosine migration, spawning, and nursery usage

   c. Ensure that water withdrawal effects (e.g., impingement and entrainment)

do not affect alosine stocks to the extent that they result in stock declines

Addendum II and III contains specific management recommendations for improving upstream and downstream passage of alosines, including requesting that member states and jurisdictions seek special consideration for alosines in the Federal Energy Regulatory Commission relicensing process.

The alosine population is severely depressed in the Merrimack River watershed (Technical Committee for Anadromous Fishery Management of the Merrimack River Basin 2010). We have achieved dramatic increases in alewife returns in recent years through a stocking effort lead by fisheries agencies and compliance with fish passage conditions in existing hydroelectric licenses, but American shad and blueback herring populations still have not shown improvement. Our goal is to restore alosines to historical habitats and ensure safe migratory pathways to build abundance and resilience in the population.

PUBLIC INTEREST

The requestor, NMFS, is a federal resource agency.

EXISTING INFORMATION AND NEED FOR ADDITIONAL INFORMATION

The Licensee conducted three separate mark-recapture studies of emigrating juvenile alosines from 1990 to 1995 (Normandeau Associates, Inc., 1991, 1994, 1995). These studies examined only entrainment into E.L. Field Powerhouse turbines and the fish bypass at the powerhouse as potential routes of passage. The early 1990's studies used antiquated technology that did not adequately address the goals and objectives of this study. We have no information regarding usage of the Pawtucket Canal or the spillway as emigration routes for juvenile alosines at the Lowell Hydroelectric Project.

PROJECT NEXUS

The Lowell Hydroelectric Project does not have entrainment prevention at the turbine intakes or designated spillway passage routes. The designated fish bypass system at the E.L. Field Powerhouse has a documented poor entrance efficiency and is unable to operate throughout the diurnal cycle. Juvenile alosines emigrate during the fall at the project, a time of year when Merrimack River flows equal or exceed the operating capacity of the power stations only part of the time. Therefore, we expect juvenile alosines have the opportunity to use multiple routes of passage during emigration. We assume entrained juvenile alosines at the Pawtucket Canal powerhouses will incur unacceptable levels of delay, injury and mortality. We base this assumption on published mortality statistics, the age and specifications of the turbines, the complexity of canal routing, and the likelihood that emigrating juvenile alosines will have to pass two turbines to reach downstream of the project (upper canal and lower canal). Conversely, we assume that turbine passage at the E.L. Field Powerhouse and passage over the spillway may be viable routes of downstream passage, but we do not have delay or mortality information supporting those assumptions. Therefore, to determine overall project survival, we need to understand the routes of emigration and the potential for delay under different river flow conditions and project operations. This study will contribute to the development of an administrative record in support of potential Section 18 fishway prescriptions or 10(j) recommendations.

PROPOSED METHODOLOGY

This study should be conducted using radio telemetry, with a study design that specifies sample size and tag and receiver configurations. Through the agency-led stocking program in the Merrimack River watershed, large numbers of juvenile alewife emigrate from the upper watershed on a yearly basis. The Licensee should catch these juveniles for the study, as these fish have been used successfully in acoustic telemetry studies for other facilities on the Merrimack River (Accession No. 20170223-5040). A statistically significant number of telemetered juvenile alewife are necessary to establish a clear understanding of how project operations affect juvenile alosine emigration (juvenile alewife will serve as a proxy for juvenile American shad and blueback herring). The Licensee should release groups of juvenile alewife during spill and non-spill periods. The Licensee should operate the Pawtucket Canal system turbines during the study. The Licensee should record river flows and project operations throughout the study. Release of tagged juvenile alewife should be a few kilometers (km) upstream of the Pawtucket Dam. Telemetry receivers and antennas will be located above and below the project to assess passage. Receivers should monitor the following potential routes: entrance into Pawtucket Canal via the Guard Lock and Gates Facility, passage over the Pawtucket Dam, entrance into Northern Canal at Pawtucket Gatehouse, entrance into E.L. Field Powerhouse turbines, and entrance into the E.L. Field Powerhouse bypass.

Mobile tracking (i.e., via boat) in river reaches between release sites and several km downstream of E.L. Field Powerhouse will be performed at regular intervals during and after releases to confirm routes and fates of fish.

Movement rates (time between release and passage) of juvenile alewife passing the projects by various routes will also be quantified using time-to-event analyses (Castro-Santos and Perry 2012).

This study will require two years of field data collection to account for inter-annual variability in river discharge and water temperatures.

Level of Effort and Cost

The level of cost and effort for the downstream juvenile alosine passage study is moderate to high. We anticipate the study will require two migratory seasons to acquire enough data. The Licensee will download the data periodically, analyze it, and report the results. We estimate the cost will be approximately $125,000 per year for the study. No alternatives are proposed.

5.3 Requested Study #3: Upstream and Downstream Adult Alosine Passage Study

The Merrimack River is a migratory corridor for alosines. These species must be able to pass the project without undue harm or delay to complete their life cycle. Poor passage at the project limits access to freshwater spawning habitats and marine habitats harming resilience within the population and ecosystem benefits to other trophic levels. The Lowell project includes potential immigration routes through the E.L. Field Powerhouse fish lift and the Pawtucket Dam fish ladder. Potential emigration routes include over the Pawtucket Dam, through the E.L. Field Powerhouse turbines, over the E.L. Field Powerhouse fish bypass, and through the Pawtucket Canal including multiple dams and powerhouses. The Licensee is installing a pneumatic crest gate at the dam that decreases leakage through the flashboards and provides more control of spill over the dam. We request a study to determine the effectiveness of the upstream fishways and

downstream passage routes at multiple river flows and operating conditions to inform safe, timely, and effective passage measures at the project.

GOALS AND OBJECTIVES

The goal of this study is to determine the impact of the Lowell Hydroelectric Project on the migration of adult alosines in the Merrimack River. Project operations can result in delay, mortality or injury during migration. We need to understand the extent of delay, the passage routes, and the potential for mortality to determine measures and recommendations to increase survival and improve fish passage at the project.

The objectives of this study are:

- Quantify the movement rates and delay caused by project operations at multiple river flows.
- Quantify the relative proportion of alosines passing each migration route at the project during various project operations at multiple river flows.
- Quantify instantaneous and latent mortality of alosines passed via each migration route at multiple river flows.

RESOURCE MANAGEMENT GOALS

The NMFS is a federal resource agency with a mandate to protect and conserve fishery resources and associated habitat. Regulatory statutes codify our resource management goals and plans. We rely on the best available information and data to support conservation recommendations and management decisions. Data sought in this study are not available. This study is an appropriate request for the pre-application period.

PUBLIC INTEREST

The requestor, NMFS, is a federal resource agency.

EXISTING INFORMATION AND NEED FOR ADDITIONAL INFORMATION

Since the commissioning of the fish passage facilities at the Lowell Hydroelectric Project, passage of alosines has been unable to meet management goals. For example, greater than 50% of the tagged adult American shad that pass the downstream Lawrence Hydroelectric Project reach the Lowell tailrace, yet only a small percentage of those fish use the designated upstream fishways (Sprankle 2005), (Alden Research Laboratory 2011). Therefore, through the course of the original license, the Licensee conducted numerous studies to investigate fish passage at the project (Table 1).

Table 1. Adult Alosine Upstream and Downstream Fish Passage Studies.

Year	Study Title	Author	Study Results
1988	Passage of Radio-tagged American shad through the Northern Canal Headgate Structure: Lowell	RMC Environmental Services, Inc.	Upstream Results: Of the 25-tagged fish, 24 passed the Northern Canal Gatehouse and one died through turbine passage. Of the 24 passed fish, 19 used the boat lock and 5 used the gate wells. Fish took a few hours to reach the gatehouse from the fish lift. Those that

	Hydroelectric Project		passed the boat lock took less than a day and those that passed through the gate wells took 1 to 3 days to get to the headpond. Downstream Results: Of the 24-tagged fish, 13 approached Lowell after spawning. One of these entered the Pawtucket Canal and died. Eight went through either the Northern Canal and the remainder were undetermined routes. Only 5 fish reached Lawrence suggesting a project mortality of 61.5%. There was delay behavior approaching the gatehouse and Pawtucket Canal.
1991	Downstream Passage Routes of Radio-tagged Adult American shad at the Lowell Hydroelectric Project on the Merrimack River: Lowell, Massachusetts	Normandeau Associates, Inc.	Upstream Results: 28 of the 45-tagged fish passed the gatehouse. Downstream Results: 12 of the 28 fish approached the project after spawning. 5 went through the turbines, 2 went through the Pawtucket Canal, 2 went through the fish bypass, and 3 went over the dam. Of the 17 fish that did not pass upstream of the gatehouse, 6 died in the Northern Canal, 8 went through the powerhouse, and 3 went through the fish bypass. Project mortality through various downstream passage routes was 61%.
1997	Lowell Hydroelectric Project Internal Fish Lift Efficiency Monitoring Program, Spring 1996	Normandeau Associates, Inc.	At 50 cfs attraction flow, the fishway efficiency was 0.5%. At 90 cfs, the fishway efficiency was 2.4%. Both entrances were operating. Entrance #2 was a net loss of 4,175 shad and entrance #1 was a net gain of 113 shad.
1999	An Assessment of Internal Fish Lift Efficiency at the Lowell Hydroelectric Project, Spring 1998	Normandeau Associates, Inc.	The fishway internal efficiency increased by 10% from previous years after modifications.
2000	An Assessment of Internal Fish Lift Efficiency at the Lowell	Normandeau Associates, Inc.	At 120 cfs attraction flow, the fishway efficiency was 42% ranging from 9% to 98%.

	Hydroelectric Project, Spring 1999		
2001	An Assessment of Internal Fish Lift Efficiency at the Lowell Hydroelectric Project, Spring 2000	Normandeau Associates, Inc.	At 120 cfs attraction flow, the fishway average efficiency was 46.4% ranging from 13% to 92%. Efficiency was best at the 2-foot crowder opening (72%) and worst at the 4-foot opening (29%)
2002	Interdam Movements and Passage Attraction of American shad in the Lower Merrimack River Main Stem	U.S. Fish and Wildlife Service	Upstream results: Of the tagged fish at Lawrence, 55% entered the Lowell tailrace and 66% reached the project. Passage efficiency was 6% using tagged fish and was 10% using count room data. Downstream results: Of the four-tagged fish that passed Lowell, one died upstream, one died using the fish bypass, and the other two reached Lawrence suggesting a 33% project mortality.
2011	Shad Upstream Passage Assessment at Lowell Hydroelectric Project (FERC 2790)	Alden Research Laboratory, Inc.	Of the tagged fish at Lawrence, 57% reach the Lowell project. Shad explored the tailrace in a "U" shaped pattern along the edges. Only three fish entered the fishway.
2013	Additional Analysis of American Shad Three-Dimensional Behavior in the Tailrace of the Lowell Project	Blue Leaf Environmental	Shad exhibited a random roaming behavior within the previously determined "U" shaped pattern. Greater than 80% of the detections were between the elevations of 40 and 50 feet.

Though the Licensee has completed numerous studies over the course of their original license, additional information is necessary to determine appropriate fish passage and protection measures for adult alosines in the upcoming license. Concerning upstream passage, none of the studies simultaneously focused on both the Pawtucket Dam fish ladder and the E.L. Field Powerhouse fish lift. As both facilities are necessary to meet management goals, we need to understand route selection and delay approaching the project with both fish passage facilities operating and monitored. In 2019, the Licensee will excavate part of the Lowell tailrace to improve attraction to the riverside fish lift entrance. Therefore, we need to understand whether this measure will improve entrance efficiency. In addition, none of the previous studies incorporated both Passive Integrated Transponder (PIT) tags and radio tags on the same fish. Dual tagging of the upstream migrating fish will allow us to quantify route selection, delay, and internal fishway efficiency. Concerning downstream passage, none of the previous studies had a

statistically significant number of fish to account for tagging effects, natural post-spawn mortality, or the myriad of route selections during emigration. In addition, the new pneumatic crest gate constitutes a new hydraulic condition that may affect route selection during emigration. Finally, none of the previous studies focused on adult river herring, which exhibit different migratory behaviors than American shad.

PROJECT NEXUS

The Lowell Hydroelectric Project has two fishways that have not met alosine management goals for the Merrimack River watershed. The project also does not have entrainment prevention at any of the operating turbine intakes. In addition, project operations produce a myriad of migratory routes, both upstream and downstream, that can lead to delay, increased predation, and mortality. Information gained from this study will greatly increase our understanding of project effects. This study will contribute to the development of an administrative record in support of potential Section 18 fishway prescriptions or 10(j) recommendations.

PROPOSED METHODOLOGY

We recommend incorporating state-of-the-art telemetry methods for this study including both PIT and radio tag technology. The study design should specify sample size and tag and receiver configurations and include two years of field data collection to attempt to account for inter-annual variability in river discharge and water temperatures. Because ledge excavation in the tailrace will be occurring in 2019, a third year of study may be necessary to account for delay of the upstream passage evaluation.

The first year of study, prior to the completion of the ledge excavation, should focus on downstream passage and upstream passage through the Northern Canal only. The Licensee should tag a statistical significant number of both adult river herring and American shad during the migration run of each species captured at the Lawrence project. Each species should have two release locations, one group at the E.L. Field Powerhouse fish lift exit and the other in the Lowell project impoundment. The E.L. Field Powerhouse group should be dual tagged and the Northern Canal Gatehouse wells should be equipped with PIT tag receivers (if the boat lock is open, then receivers should be installed there as well). Release of radio-tag only groups of American shad and river herring should be a few kilometers (km) upstream of the Pawtucket Dam. A small sample of dead river herring and shad should be included in this release to act as a control group, as fish can drift significant distances downstream after they have died (Havn et al. 2017) Radio telemetry receivers and antennas will be located above and below the project to assess passage. Receivers should monitor the following potential routes: entrance into Pawtucket Canal via the Guard Lock and Gates Facility, passage over the Pawtucket Dam, entrance into Northern Canal at Pawtucket Gatehouse, entrance into E.L. Field Powerhouse turbines, and entrance into the E.L. Field Powerhouse bypass.

During the study seasons following the ledge excavation, the Licensee should tag a statistical significant number of both adult river herring and adult American shad captured at the Lawrence project during their migration run. Half of the test specimens for each species should be dual-tagged. The release location for all test specimens should be the Lawrence impoundment. In addition to the receivers installed during the first year of study, the Licensee should equip the entrance and exit of both fishways with PIT tag receivers (the ladder should have an additional PIT receiver in the turning pool) to evaluate fishway efficiencies. The Licensee should also equip the tailrace entrance, the fish lift entrance, and three equally spaced locations within the bypass

reach (e.g., downstream cross-section, mid-point cross-section, and proximal to the ladder entrance) with radio tag receivers.

The Licensee should release groups of test specimens during spill and non-spill periods. The Licensee should operate the Pawtucket Canal system turbines during the study. The Licensee should record river flows and project operations throughout the study.

Mobile tracking (i.e., via boat) in river reaches between release sites and several km downstream of E.L. Field Powerhouse will be performed at regular intervals during and after releases to confirm routes and fates of fish.

Movement rates (time between release and passage) of juvenile alewife passing the projects by various routes will also be quantified using time-to-event analyses (Castro-Santos and Perry 2012).

Level of Effort and Cost

The level of cost and effort for the upstream and downstream alosine passage study is high. The study will require at least two migratory seasons to acquire enough data. Because of the ledge excavation, a third year of study is likely for the comprehensive upstream and downstream telemetry study depending on the environmental and operating conditions of the second year. The Licensee will download the data periodically, analyze it, and report the results. We estimate the cost will be approximately $150,000 for the first year study and $300,000 per year for the comprehensive study. No alternatives are proposed.

5.4 Requested Study #4: Project Survival Study

The Merrimack River is migratory corridor for a multitude of diadromous fish species including American eel, American shad, river herring, and Atlantic salmon. These species must be able to pass the Lowell Hydroelectric Project without significant mortality. The Lowell project includes 2 identical full Kaplan units at the E.L. Field Powerhouse and 19 Francis units of various specifications through a two-tiered canal system in downtown Lowell (12 units are still operating). Each of these turbine passage routes represent a significant risk of mortality to emigrating fish. In addition, the Licensee installed new pneumatic crest gates on the Pawtucket Dam with improved spill control that may provide a safe emigration route. We request a study to determine project survival by quantifying turbine mortality and injury under multiple operating conditions to inform safe, timely, and effective downstream passage measures at the project.

Goals and Objectives

The goal of this study is to quantify project survival for emigrating diadromous species that pass through project turbines. The objectives of the study are to:

- Conduct a field study of turbine survival at the E.L. Field Powerhouse with adult American eels and adult American shad.
- Conduct a desktop survival study for the full suite of diadromous species and life stages through all of the project units.

Resource Management Goals

The NMFS is a federal resource agency with a mandate to protect and conserve fishery resources and associated habitat. Regulatory statutes codify our resource management goals and plans. We

rely on the best available data to support conservation recommendations and management decisions. Data sought in this study are not available. This study is an appropriate request for the pre-application period.

PUBLIC INTEREST

The requestor, NMFS, is a federal resource agency.

EXISTING INFORMATION AND NEED FOR ADDITIONAL INFORMATION

Turbine mortality is a well-documented effect of hydroelectric facility operation on the fisheries resource. In the last half-century, dozens of previous licensing studies quantified the effects of many types of turbines. Industry professionals have compiled much of this information in a database (EPRI 1997). In general, American eels have higher survival passing Francis turbines and alosines have higher survival passing Kaplan turbines (Pracheil et al. 2016). However, the extent of turbine mortality relates to the species, life stage, and the specifications of the turbine, which result in dramatic differences in turbine survival. Fish length, runner rotational speed, and the number of runner blades are key variables determining turbine mortality (Headrick 2001).

In 2003, the Licensee completed a comprehensive study of the Atlantic salmon smolt survival through the E.L. Field Powerhouse (Normandeau Associates Inc. 2003). The results from that study were favorable with the desktop analysis predicting 94% survival and the field test results showing 100% survival. However, the average length of the Atlantic salmon smolts in that study was 202.8 millimeters (mm). Adult American eel and American shad are much longer, approximately 1,000 mm and 450 mm, respectively. Because fish length is a key determinant of turbine survival, we need quantitative field data for larger fish with different swimming forms and abilities to conclude that the E.L. Field Powerhouse turbines are a safe route of emigration for the full suite of diadromous species. In addition, the previous smolt study only looked at one operational scenario for the full Kaplan units. Unlike smolts, both American eel and American shad will emigrate past the facility during times when river flow is well below operational capacity. Finally, American eels are more susceptible to blade strike with Kaplan turbines and the previous telemetry studies of American shad suggested poor turbine survival at the E.L. Field Powerhouse (RMC Environmental Services 1988) (Normandeau Associates Inc. 1991).

None of the previous studies conducted at the Lowell Hydroelectric Facility examined the potential for eel or alosine turbine mortality in the Pawtucket Canal units using estimates from either turbine mortality equations or field studies. Based on our hydrologic analysis, during the downstream fish passage season as defined in the existing Comprehensive Fish Passage Plan, the downtown canal units will be operating approximately 40% of the time (Figure 1). Therefore, the Pawtucket Canal may be an emigration route. We need to understand the risks of mortality for fish that migrate through the Pawtucket Canal.

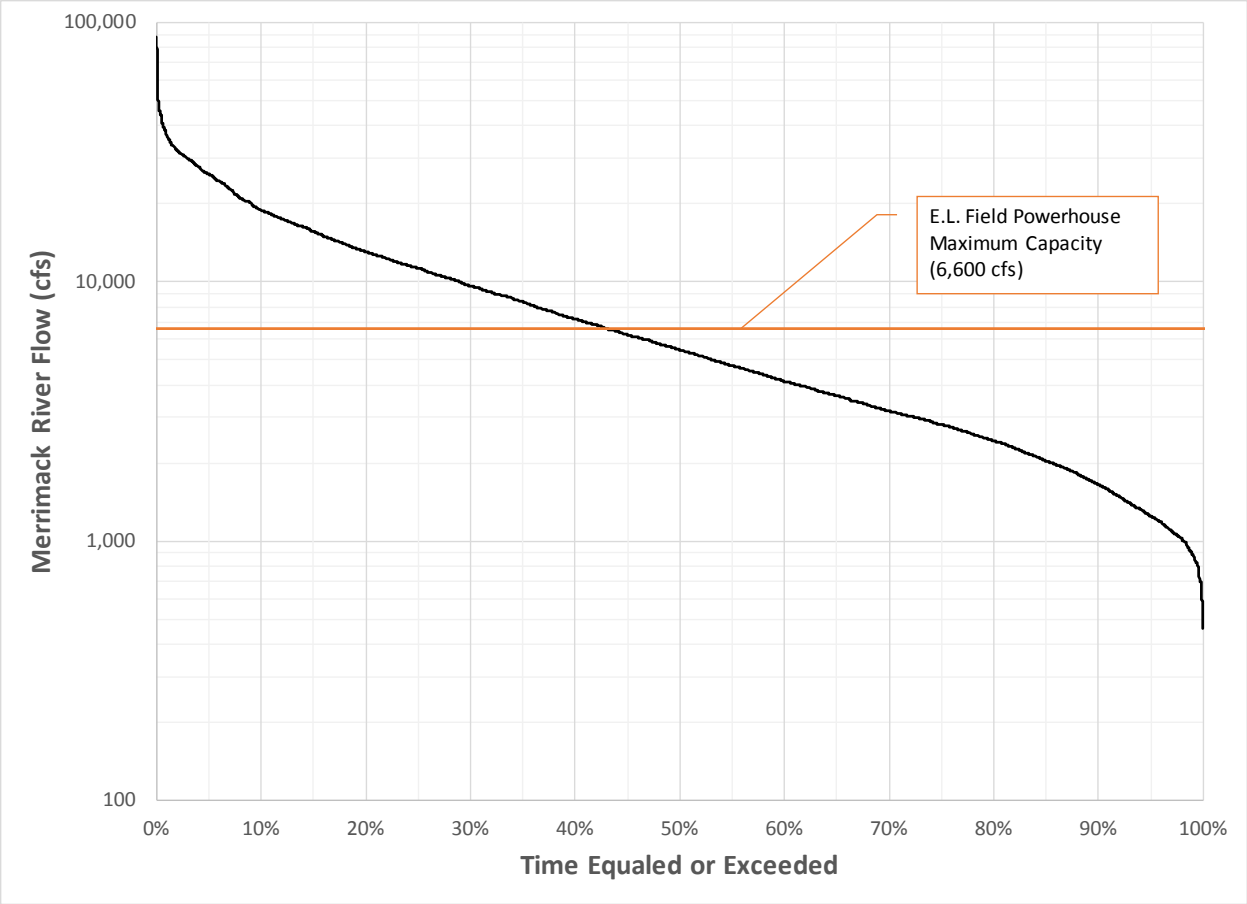

Figure 1. Flow duration curve for the Merrimack River during the downstream fish passage season showing the amount of time river flow equals or exceeds the E.L. Field Powerhouse maximum discharge capacity.

PROJECT NEXUS

Operation of the Lowell Hydroelectric Project has a direct effect on the survival of emigrating diadromous fish through turbine passage. None of the 14 operating turbines has entrainment prevention leading to the potential for high turbine mortality at the project. Information gained from this study will greatly increase our understanding of project effects. This study will contribute to the development of an administrative record in support of potential Section 18 fishway prescriptions or 10(j) recommendations.

PROPOSED METHODOLOGY

The E.L. Field Powerhouse turbine field study should use the balloon tag-recapture technology. A methodology similar to the one outlined in the previous Atlantic salmon study is acceptable (Normandeau Associates Inc. 2003). A statistically significant number of both adult American eels and American shad are necessary for testing at two turbine settings, a low operational flow (less than 1,200 cfs) and a high operational flow (between 1,800 and 3,300 cfs). The Licensee should evaluate and document the fitness of the test specimens used in the study.

The desktop turbine survival study should use standard methodology appropriate for the type of turbine and empirical information available (Franke et al. 1997). The Licensee should evaluate each of the unique turbines still in operation including:

- the E.L. Field, Fuji Horizontal Full Kaplan,
- the Bridge Street, Hercules Type D Single Runner,
- the Hamilton, Leffel Type Z Single Runner at
    - 120 rpm
    - 133 rpm
    - 150 rpm,
- the John Street, Leffel Single Runner, and
- the John Street, Allis Chalmers Singe Runner.

The turbine survival assessment should evaluate American shad, American eel, and river herring. The Licensee should evaluate both adult and juvenile life stages for the alosines. The study should use published average length values for each species and life stage in the calculations. Alewife may be used as a proxy for both river herring species. After determining estimates for each unique turbine, the Licensee will derive overall project survival estimates using typical operating curves and expected flows (i.e., the flow duration curve) during the downstream migration season for each species. The Licensee should use the rule of thumb that fish will emigrate proportionally with flow to estimate overall project survival. Where applicable, the Licensee should use turbine survival based on field collected data instead of calculated estimates.

Level of Effort and Cost

The level of cost and effort for the project survival study is moderate. The study will likely take one year. The Licensee will collect the field data during the migratory season, calculate the turbine survival estimates, estimate overall project survival, and report the results. We estimate the cost will be approximately $120,000 for the study. No alternatives are proposed.

5.5 Requested Study #5: Three-dimensional Hydraulic Modeling

Complex flow fields occur upstream of the entrance to powerhouse intakes and dedicated fish bypasses, downstream of fishway entrances, and internally within a fishway. With respect to downstream passage, we need to understand the direction and magnitude of flow fields that are upstream of the turbine intakes and fish bypass in order to inform license conditions that may improve downstream passage. Concerning upstream passage, we need to understand the hydraulic conditions proximal to the entrances of both fishways to inform license conditions that may improve fishway attraction. In addition, internal hydraulics (particularly upwelling from floor diffusers) can cause fallback from committed immigrants in a fishway. We request a three-dimensional computational fluid dynamics (CFD) modeling study to understand the hydraulics of integral components of the fish passage facilities at the Lowell Hydroelectric Project.

Goals and Objectives

The goal of this study is to determine the flow field conditions that exist in and around the Lowell fish passage facilities. The objectives of the study are to:

- Develop and calibrate a three-dimensional model of the E.L. Field Powerhouse forebay and downstream bypass facility then run simulations of various operational conditions.
- Develop and calibrate a three-dimensional model of the E.L. Field Powerhouse fish lift then run simulations of various operational conditions.
- Develop and calibrate a three-dimensional model of the Pawtucket Dam fish ladder then run simulations of various operational conditions.

RESOURCE MANAGEMENT GOALS

The NMFS is a federal resource agency with a mandate to protect and conserve fishery resources and associated habitat. Regulatory statutes codify our resource management goals and plans. We rely on the best available data to support conservation recommendations and management decisions. Data sought in this study are not available. This study is an appropriate request for the pre-application period.

PUBLIC INTEREST

The requestor, NMFS, is a federal resource agency.

EXISTING INFORMATION AND NEED FOR ADDITIONAL INFORMATION

No three-dimensional models exist for the fish passage facilities at the Lowell Hydroelectric Project. Documented issues with the fish passage facilities include poor entrance efficiency at the E.L. Field Powerhouse downstream bypass, poor entrance efficiency at the E.L. Field Powerhouse upstream fish lift, and fallback in both fishways. Detailed hydraulic modeling of the fish passage facilities will elucidate potential license conditions and measures that may improve fish passage at the project.

PROJECT NEXUS

With the existing fish passage facilities, the Lowell Hydroelectric Project has not met management goals for anadromous fish in the Merrimack River Watershed. Either new infrastructure, operational changes, or both are necessary to avoid and minimize project effects on fish populations in the Merrimack River and the Atlantic Ocean. The results of this study will inform future measures at the project to improve fish passage.

PROPOSED METHODOLOGY

A three-dimensional CFD model has become an increasingly common standard of analysis at hydroelectric projects around the nation. Within the Northeast region, we have used these models to address fish passage issues at the Holyoke (P-2004), Turners Falls (P-1889) Brunswick (P-2284), Shawmut (P-2322), Milford (P-2534) and Orono (P-2710) projects. Many three-dimensional hydraulic software packages are acceptable for this requested study, one of which is open source. We are not recommending one model over another, but the Licensee shall understand and document the limitations of the modeling software used. At a minimum, the modeling output should produce velocity, turbulence, and water depth for each cell in the mesh. The modeling domain shall be of sufficient size and mesh to characterize the hydraulic environment for each fishway evaluated. The domain for the forebay model should include the Northern Canal where the flow is relatively uniform and continue to the trash racks and to the point of free discharge in the fish bypass. The domain for the E.L. Field Powerhouse fish lift model should include upstream of the hopper through the tailrace where the highest density of detections occurred in the three-dimensional telemetry study (Alden Research Laboratory 2011), (Blue Leaf Environmental 2013). This model

should reflect conditions after ledge removal in the tailrace. The domain of the Pawtucket Dam fish ladder model should include the exit flume through the ladder and past the influence of the entrance jet and any auxiliary attraction water supply (e.g., adjacent crest gate and sluice gates). Calibration of each model should include a low and a high design flow to bracket the simulated hydraulic conditions, if possible. In order to understand project effects, multiple simulations of each calibrated model are necessary to evaluate hydraulic issues for the full range of design flows (i.e., up to 5% exceedance values during the migratory period) and typical existing operating conditions. At a minimum, we expect the following simulations:

- Forebay model with downstream bypass set at 5% E.L. Field Powerhouse turbine discharge.
    - Minimum flow, Unit 1
    - Minimum flow, Unit 2
    - 5% exceedance, both units
    - 75% exceedance, typical unit setting
- Fish lift model with auxiliary water supply (AWS) set at recommended settings.
    - Minimum flow, Unit 1
    - Minimum flow, Unit 2
    - 5% exceedance, both units
    - 50% exceedance, both units
- Fish ladder model with AWS set at recommended settings.
    - Minimum flow, AWS from adjacent crest gate
    - Minimum flow, AWS from sluice gate
    - 5% exceedance, typical spill settings

Model output should show potential hydraulic conditions that effect fish passage. For example, eddy formation, zones of rapid acceleration/deceleration, upwelling, high/low velocity, and high turbulence areas.

LEVEL OF EFFORT AND COST

The level of cost and effort for the three-dimensional CFD modeling study is moderate. The study will likely take one year. The Licensee will develop the models using existing drawings supplemented with limited survey, collect calibration data, run simulations, and report the results. We estimate the cost will be approximately $175,000 for the study. No alternatives are proposed.

5.6 REQUESTED STUDY #6: BYPASS ZONE-OF-PASSAGE STUDY

The Merrimack River is migratory corridor for a multitude of diadromous fish species including American eel, American shad, river herring, sea lamprey, and Atlantic salmon. These species must be able to pass the project without undue harm or delay to complete their life cycles. Poor passage at the project limits access to upstream spawning habitats harming genetic diversity and resilience within the population. The Lowell project includes an approximately 0.7-mile-long bypass reach from Pawtucket Dam to the E.L. Field Powerhouse tailrace. The powerhouse houses a fish lift and the dam includes a fish ladder that provide fish passage. The Licensee installed the dam fish ladder as a condition under the original license to provide passage at the dam during periods when river flow was high enough that the Project spilled. Due to increased numbers of diadromous species and fish observed at Lowell over the last decade and the

ineffectiveness of the fish lift, the Merrimack River Anadromous Fish Restoration Technical Committee decided to operate the fish ladder throughout the season, regardless of spill conditions. In addition, the Licensee has subsequently installed a pneumatic crest gate at the dam that decreases leakage through the flashboards and provides more control of spill over the dam. We request a study to determine a zone-of-passage through the bypass reach at multiple flows to ensure safe, timely, and effective passage at the project. A zone-of-passage is defined as the contiguous area of sufficient lateral, longitudinal, and vertical extent in which adequate hydraulic and environmental conditions are maintained to provide a route of passage through a stream reach influenced by a hydroelectric project (USFWS 2017).

GOALS AND OBJECTIVES

The goal of this study is to determine the zone-of-passage at multiple flows in the bypass reach that facilitate safe, timely, and effective fish passage through the project. The objectives of the study are to:

- complete a detailed survey of the bypass reach,
- develop a high-resolution, two-dimensional hydraulic model of the bypass reach,
- release multiple flows from the dam to collect calibration data for the model,
- simulate additional flows through the bypass reach with the calibrated model, and
- determine minimum and optimal zone-of-passage in the project bypass reach.

RESOURCE MANAGEMENT GOALS

The NMFS is a federal resource agency with a mandate to protect and conserve fishery resources and associated habitat. Regulatory statutes codify our resource management goals and plans. We rely on the best available data to support conservation recommendations and management decisions. Data sought in this study are not available. This study is an appropriate request for the pre-application period.

PUBLIC INTEREST

The requestor, NMFS, is a federal resource agency.

EXISTING INFORMATION AND NEED FOR ADDITIONAL INFORMATION

Article 36 of the original license required the Licensee, after consultation with resource agencies, to develop an in-stream flow study plan to determine the relationship between project discharges and downstream aquatic habitat and a fishery study plan to determine project discharges necessary to provide for the migration of anadromous fish (i.e., zone of passage). After completion of the approved studies, the Licensee shall file a report on the results of the studies, and, for Commission approval, recommendations for the flow releases from the project. The Licensee filed the study plan on August 13, 1983 with proof of agency consultation (Accession No. 19830818-0191). However, we have been unable to obtain the reports required under Article 36. We have no reports on file nor have we found that the Licensee filed the reports in the eLibrary. Therefore, we have no quantitative data supporting the agreement that 300 cubic feet per second (cfs) at night and 500 cfs during the day are adequate for a zone-of-passage in the bypass reach as mentioned in the letter dated August 8, 1983 accompanying the study plan.

In the Comprehensive Fish Passage Plan filed on March 9, 2000 (Accession No. 20000313-0322), the Licensee states:

The adequacy of flows for upstream fish passage at the Project was addressed by BHI's construction of six (6) concrete flow control weirs (with adjustable stoplog sections) in the bypass reach, at the request of U.S. Fish and Wildlife Service and in response to Article 36, section (2) of the Project's FERC license.

Similar to the study plan, we have an agreement with no supporting information that substantiates the conclusion that these are adequate flows for a zone-of-passage in the bypass reach for the full suite of diadromous species.

As part of compliance for Article 34 of the original license, the Licensee filed as-built drawings of the fish passage facilities (Accession No. 19860902-0215). Within this abbreviated drawing set, drawing number 344D-PC001, 3844D-FC001, and 3844D-FC004 show topographic survey for small portions of the bypass reach. However, the drawings do not document the accuracy and precision of the survey, the drawing quality is illegible, and the drawings do not show the majority of the bypass reach.

This existing, supporting data is sparse, antiquated, and inadequate to determine the zone-of-passage at multiple flows in the bypass reach. Since agreeing upon the current zone-of-passage flows during the original license, we have new technologies in topographic survey methods, a better understanding of the hydraulic requirements of diadromous species, multi-dimensional hydraulic modeling capabilities, and an increased need to pass fish at the spillway ladder.

PROJECT NEXUS

Diadromous fish orient their migration based on the environmental conditions of the river: flow, depth, velocity, and temperature (Goodwin et al. 2014). Project operations affect the environmental conditions in the river, including the bypass reach. Two key hydraulic model outputs from the requested study are depth and depth-averaged velocity, which we can use to determine the likelihood of predation, delay, and the cessation of migration. Evaluating the flow fields in the bypass reach under different spill conditions will assist in the consultation process for determining a zone-of-passage in the bypass reach to optimize fish passage at the project. These data will contribute to the development of an administrative record in support of a potential settlement agreement, Section 18 fishway prescriptions, or 10(j) recommendations.

PROPOSED METHODOLOGY

We proposed the following methodology to accomplish the five objectives and ultimately the goal of the study, to determine zone-of-passage flows for the bypass reach.

1) Topographic survey

   The bypass reach area is large making traditional topographic survey methods laborious and costly. We recommend using Light Detection and Ranging (LiDAR) methods with limited traditional surveying. Outside of the fish passage season and during a river flow when the project is in control of the river, the bypass reach will be mostly dewatered. At this time, a licensed surveyor can fly the area to collect LiDAR data. Once this data is processed, traditional methods will fill in the gaps (e.g., pooled water areas, under bridges). The topographic survey shall be of sufficient resolution and quality to complete the remaining objectives.

2) Two-dimensional hydraulic model

There are many two-dimensional hydraulic models that are acceptable for accomplishing the goal of this requested study, many of which are open source. We are not requiring one model over the other, but the Licensee shall understand and document the limitations of the modeling software used. At a minimum, the modeling output should produce depth-average velocity and water depth for each cell in the mesh. The modeling domain shall be of sufficient size and mesh to delineate a zone-of-passage through the entire length and width of the bypass reach.

3) Calibration flows

The Licensee shall collect calibration data by spilling a minimum of two flows from the Pawtucket Dam. The calibration flows shall bracket the range of simulated flows in the study. We recommend 300 cfs for the low flow as it represents the current lowest operation flow for the fish ladder. For the high calibration flow, we recommend collecting data near the high fish passage design flow (i.e., the 5% exceedance value for the migratory period of record) which is approximately 26,000 cfs in the Merrimack River (bypass flow would be approximately 17,000 cfs with full project generation). The Licensee shall collect calibration data (depth-averaged velocity and depth) with an Acoustic Doppler Current Profiler (ADCP) at a minimum of four cross sections, including the downstream boundary condition. The Licensee shall use the ADCP in locations spread evenly throughout the bypass that have hydraulic conditions that are conducive to accurate readings (i.e., less turbulence).

4) Additional flow simulations

After calibrating the model, the Licensee shall simulate additional bypass flows including 500 cfs, 1,000 cfs, and couple other flows up to the high calibration flow. The additional simulations should represent the full range of hydraulic conditions in the bypass reach from the low to high fish passage design flow.

5) Zone-of-passage determination

The Licensee will use the model output to delineate a zone-of-passage pathway for each of the modeled flows. To determine the zone-of-passage, the Licensee will use the SprintSwim model developed by U.S. Geological Survey researchers (Haro et al. 2004).

LEVEL OF EFFORT AND COST

The level of cost and effort for the project survival study is low to moderate. The Licensee should be able to finish the bypass zone-of-passage study in one year depending on seasonal flow conditions. We estimate the cost to be approximately $80,000. No alternatives are proposed.

Ms. Bernardo, Mr. Nasdor, and Mr. Hollenbeck:

On behalf of Boott Hydropower, LLC (Boott), I am distributing the attached consultation request in support of the Federal Energy Regulatory Commission (FERC) relicensing of the Lowell Hydroelectric Project (Project). As described in the attached correspondence, Boott is consulting with the National Park Service, American Whitewater, and the Massachusetts Department of Conservation and Recreation to identify locations in the Project's vicinity to conduct visitor intercept surveys of recreationists for the approved Recreation and Aesthetics Study.

Should you have any questions regarding the attached correspondence, please contact Kevin Webb with Boott at 978-935-6039 or Kevin.Webb@enel.com.

Thank you,

Re: Lowell Hydroelectric Project (FERC No. 2790-072);
Consultation Regarding the Water Level and Flow Effects on Historic Resources Study

Dear Ms. Bernardo,

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc. (Enel), is the Licensee and operator of the 22.4 megawatt (MW) Lowell Hydroelectric Project (Project or Lowell Project). The Lowell Project is located on the Merrimack River in Middlesex County, Massachusetts, and in Hillsborough County, New Hampshire. The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) with an effective date of May 1, 1973. The existing license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process (ILP), as described at 18 Code of Federal Regulations (CFR) Part 5.

In accordance with the Commission's Study Plan Determination issued on March 13, 2019, Boott is initiating consultation with the National Park Service (NPS) regarding the locations of water level loggers (pressure transducers) to be placed within the Lowell canal system for the Water Level and Flow Effects on Historic Resources Study. As part of the study, Boott will temporarily install level loggers at up to ten locations within the canal system. At each location, Boott will install one primary and one backup level logger, for a total of twenty level loggers. The level loggers will record water elevations in 15-minute increments from May 2019 through May 2020. In addition to these loggers, water levels at the Pawtucket Dam and E.L. Field Powerhouse forebay are logged by the Project's control system

The information collected will be compared to Project operational and flow data for the period of record to assess how Project operations and flows into the canal system effect water levels, which in turn may affect historic resources and NPS operations. Boott will conduct the assessment of the data in the spring and summer of 2020.

As shown in Figure 1 provided as Attachment A, Boott is proposing ten strategic and representative locations to deploy the level loggers within the Lowell canal system. These level logger locations may be slightly revised based on site conditions encountered during deployment. As we are planning on deploying these loggers in the near term, Boott respectfully requests any comments regarding these proposed deployment locations within 15 days of this letter (i.e. by May 22, 2019). If we do not receive a response from your office, Boott will move forward with the temporary installation of the level loggers at the locations shown on the attached map.

On behalf of Boott, I appreciate the opportunity to consult with the NPS regarding this study. Please do not hesitate to contact me at (978) 935-6039 if you have any questions concerning this matter.

Sincerely,
Boott Hydropower, LLC

Re: Lowell Hydroelectric Project (FERC No. 2790-072);
Consultation Regarding the Recreation and Aesthetics Study

Dear Stakeholders:

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc. (Enel), is the Licensee and operator of the 22.4 megawatt (MW) Lowell Hydroelectric Project (Project or Lowell Project). The Lowell Project is located on the Merrimack River in Middlesex County, Massachusetts, and in Hillsborough County, New Hampshire. The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) with an effective date of May 1, 1973. The existing license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process (ILP), as described at 18 Code of Federal Regulations (CFR) Part 5.

In accordance with the Commission's Study Plan Determination issued on March 13, 2019, Boott is initiating consultation with the National Park Service (NPS), American Whitewater, and the Massachusetts Department of Conservation and Recreation (MADCR) to identify specific locations for field reconnaissance and visitor-intercept surveys. As part of the Recreation and Aesthetics Study, Boott will conduct field reconnaissance and visitor-intercept interviews at specific recreational facilities during the prime recreational season from May 2019 through October 2019. Boott will interview recreationists visiting these locations to collect data relevant to visitors' recreational experience in the Project area, including but not limited to, data regarding demographics, types of recreational activities participated in or may participate in during their visit, and their reasons for choosing the site or area. As a separate component of the Recreation and Aesthetics Study, Boott is hosting an online version of the visitor-intercept survey to capture additional recreationists that would like to participate (the online version of the visitor survey is available at: https://hdrinc.co1.qualtrics.com/jfe/form/SV_0AnPxTboxMRT8nX). Boott will install signage informing recreationists of the online survey at various locations determined in consultation with NPS.
As shown in Figure 1 provided as Attachment A, Boott is proposing the following nine locations to conduct the reconnaissance and visitor-intercept surveys:

- Lowell Heritage State Park
- Merrimack Trail System

- Pawtucket Falls Overlook
- NPS Canal Walkways
- Lowell National Historic Park
- Lowell National Historic Park Visitor Center
- Chelmsford Boat Access
- Rourke Brothers Boat Ramp
- Merrill Park

Boott is also proposing ten locations[1] (as shown in Figure 1) to install the temporary signs informing recreationists of the online survey opportunity. Boott respectfully requests any comments regarding the proposed reconnaissance and visitor-intercept locations or the signage locations within 15 days of this letter (i.e., by May 22, 2019). Following consultation with stakeholders, Boott will develop the final list of reconnaissance and visitor-intercept locations and will file the final list with the Commission and distribute to American Whitewater, NPS, and the MADCR. If we do not receive a response from your office, Boott will move forward with the study to include the visitor-intercept survey locations as shown in the attached figure.

On behalf of Boott, I appreciate the opportunity to consult with your offices regarding this study. Please do not hesitate to contact me at (978) 935-6039 if you have any questions concerning this matter.

Sincerely,
Boott Hydropower, LLC

Kevin M. Webb
Hydro Licensing Manager

Subject: Lowell Hydroelectric Project (FERC No. 2790-072) -- Consultation Regarding the Water Level and Flow Effects on Historic Resources Study
Attachments: 20190507 Lowell Hydro Project Flow Effects Study Consultation.pdf

Ms. Bernardo:

On behalf of Boott Hydropower, LLC (Boott), I am distributing the attached consultation request in support of the Federal Energy Regulatory Commission (FERC) relicensing of the Lowell Hydroelectric Project (Project). As described in the attached correspondence, Boott is consulting with the National Park Service to identify locations at the Project where water surface level loggers will be temporarily installed to record data for the approved Water Level and Flow Effects on Historic Resources Study.

Should you have any questions regarding the attached correspondence, please contact Kevin Webb with Boott at 978-935-6039 or Kevin.Webb@enel.com.

Thank you,

Robert Quiggle, RPA
Regulatory and Environmental Section Manager

Dear Kevin,

I write in response to your letter of May 7, 2019 regarding the proposed locations for field reconnaissance user intercept surveys for the Lowell Hydroelectic Project Recreation and Aesthetics Study. Thank you for reaching out to us to solicit our feedback in accordance with the requirements of the Study Plan Determination.

While the proposed locations will provide useful information to better understand aspects of current and future recreational use in the project area, these proposed locations will not collect information that will enable the Licensee and FERC to evaluate recreational demand for flows, access, and facilities that would support whitewater boating opportunity in the bypassed reach or in other areas that are impacted by project operations. There is well established history of whitewater boating on the Concord River during the spring freshet, demonstrating that there is strong interest in whitewater boating opportunity in the project area. Given the current lack of flows, access and information that would provide for whitewater boating opportunity in the bypassed reach, we do not believe that the survey locations will adequately collect information that will be useful for determining future whitewater boating use.

We recommend that the Licensee utilize the online survey instrument to collect information from whitewater boaters to evaluate the demand for whitewater boating opportunity at the project. In addition, the Licensee should incorporate into this study the results of the planned whitewater boating study that will evaluate the suitability of the bypassed reach for whitewater boating. We also recommend that the licensee collect user intercept surveys at the whitewater takeout on the Merrimack River below the confluence with the Concord River during weekends during the spring freshet in 2020 in order to include information from whitewater boaters in this study.

Thank you for considering this information in the development of the survey plan.

We look forward to working with you throughout the relicensing process.

Very truly yours,

Bob Nasdor

Great! We will actually be meeting at the Boott Cotton Mills Museum at the Foot of John Street. There is pay parking in the Joseph Downes Garage at 75 John Street. He can walk to the Boott Mills Museum, but rather than going in the entrance, he should continue down the mill courtyard to the business entrance. There he can enter and take the elevator up to the 5th floor where we will be meeting in the conference room (left out of the elevators). My cell phone is 508.415.4715 should he need to reach me.

Scott,

The City of Lowell is carrying out a number of bridge construction project this year and the crew is experiencing issues controlling water. There is a moderate probability the entire canal system will be drained down next week to diagnose and resolve the problem. City is being fined thousands of dollars daily while work cannot not resume and the water control issue cannot be delayed. Is there any chance you could rework your schedule for the following week?

Scott,

Now that the Eastern Canal is drained for bridge work, there is a lot of trash visible on the canal bottom. This includes electronics and other hazardous items. Our staff are in a required 2-day occupational hazard training Tuesday and Wednesday next week. Would it at all be possible to meet in the field with you Thursday instead?

Scott,

Celeste asked me to coordinate your trash survey next week with our staff and partners. I have gathered information from our staff on the areas where trash collects (see attached map). I am very interested in meeting with you to discuss the issues and problem areas. I'd also be interested in accompanying you and others for part of your field work. I'm collecting the availability of other staff and partners that would like to be involved in the study. Have you narrowed your field work within next week? My availability next week is as follows, will update you when I hear back from a couple of others.

Mon 6/17 - After 2 pm

Tue 6/18 - after 12 pm

Wed 6/19 before 2 pm

Thurs - anytime

Fri - anytime

Celeste,

As part of the Lowell Recreation and Aesthetics Study, HDR is planning on visiting the Project the week of June 17-21, 2019 to survey and document waterborne trash as outlined in the study plan approved by the Federal Energy Regulatory Commission. In accordance with the approved plan, HDR is conducting this work in the spring of 2019 when higher flows typically push trash and debris downstream. Based on our meeting last week, HDR understands that NPS staff is very familiar with locations within the canal system where waterborne trash accumulates. In anticipation of our visit, HDR would like to coordinate with your office to identify these areas so that we can accurately document and record these locations.

Accordingly, we are hoping to meet with you or your staff to briefly review project maps prior to the start of fieldwork. If you could let me know a good time during the week of June 17 to meet with you or appropriate NPS staff, it would be greatly appreciated. Please note that NPS staff is also welcome to accompany us as we conduct this fieldwork (we expect the work to take about a day to complete).

Thank you,

Scott A. Jones, B.S., PWS

Re: Lowell Hydroelectric Project (FERC No. 2790-072);
Whitewater Boating and Access Study

Dear Stakeholders:

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc. (Enel), is the Licensee and owner of the 22.4 megawatt Lowell Hydroelectric Project (FERC No. 2790) (Project or Lowell Project). The Lowell Project is located on the Merrimack River in Middlesex County, Massachusetts, and in Hillsborough County, New Hampshire. The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) with an effective date of May 1, 1973. The existing license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process (ILP), as described at 18 Code of Federal Regulations Part 5.

In accordance with the ILP, Boott developed a Pre-Application Document (PAD) and Notice of Intent (NOI) which were filed with the Commission on April 30, 2018 to initiate the formal relicensing process. By letter dated August 8, 2018, American Whitewater (AW) provided comments on the PAD and NOI and requested that Boott undertake a controlled flow release whitewater study in support of Project relicensing. Pursuant

to the requirements of the ILP, Boott developed a Proposed Study Plan (PSP) that was filed with the Commission on September 28, 2018. In the PSP, Boott proposed a Whitewater Boating and Access Study to assess the Project's bypass reach for whitewater boating and boater accessibility. A revised Whitewater Boating and Access Study plan was filed in Boott's January 28, 2019 Revised Study Plan (RSP) for Project relicensing. As described in the RSP, Boott proposed to conduct a Whitewater Boating and Access Study based on the guidance provided in *Flows and Recreation: A Guide to Studies for River Professionals*[1]. FERC issued the Study Plan Determination (SPD) for the Project on March 13, 2019. The Commission's SPD approved the Whitewater Boating and Access Study plan without modifications.

As described in the approved Whitewater Boating and Access Study plan, Boott has proposed to form a Whitewater Boating and Access Study Working Group (Working Group) to assist in study planning and coordination and to identify volunteer boaters to participate in this study. As an initial step in the planning process, Boott is inviting potentially interested stakeholders to participate in a Working Group site visit at the Project to discuss the study schedule and logistics, volunteer participation, general safety, flow releases, and the survey forms included as appendices D, E, and F of the RSP. During this site visit, the Working Group will also conduct a reconnaissance of the Project's bypass reach to identify site-specific safety concerns and access areas.

Boott invites stakeholders to participate in a Working Group site visit at the Project on August 8, 2019 from 9:00 AM until 12:00 PM. Please notify the undersigned at Kevin.Webb@enel.com if you intend to participate in the Working Group site visit or if you would like to suggest a different date and/or time. Parties interested in participating should meet at the Project's E.L. Field Powerhouse located at 145 Pawtucket Street, Lowell, Massachusetts 01854. Please wear sturdy footwear; no sandals, open-toed shoes, or shorts.

At this time, Boott is not aware of other stakeholders or organizations with an interest in participating in the Working Group. If your office knows of any additional stakeholders or organizations who should be invited to participate, Boott respectfully requests that you notify the undersigned via email at your earliest convenience so that they can be invited to participate in the site visit.

On behalf of Boott, I appreciate the opportunity to consult with you, and we look forward to meeting with you in August to discuss the upcoming Whitewater Boating and Access Study. Please do not hesitate to contact me at (978) 935-6039 or via email at Kevin.Webb@enel.com if you have any questions concerning this study or Project relicensing.

Sincerely,
Boott Hydropower, LLC

Hi All-

We have invited the Lowell Fire Chief to attend the working group meeting (awaiting confirmation).
The City's perspective on emergency responder access to the bypass area will be an important component to consider for the study.

Looking forward to our meeting Thursday.

Thank you,

Elise Anderson

Dear Stakeholders:

Based on feedback from American Whitewater and the National Park Service, we are confirming the Whitewater Boating and Access Study Working Group site visit at the Lowell Hydroelectric Project on August 8, 2019. Participants indicated that an afternoon meeting would be best; accordingly, we are inviting interested stakeholders to **meet at 12 PM on Thursday, August 8, 2019 at the E.L. Field Powerhouse** located at 145 Pawtucket Street, Lowell, Massachusetts 01854. We expect the site visit will last about three hours. As a reminder, please wear sturdy footwear; no sandals, open-toed shoes, or shorts. Should you have any questions about the site visit, please contact me at the phone number or email address below, or contact Mr. Kevin Webb, Enel Hydro Licensing Manager, at 978-935-6039 or via email at Kevin.Webb@enel.com.

Thank you,

Dear Stakeholders:

Boott Hydropower, LLC, a subsidiary of Enel Green Power North America, is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the Lowell Hydroelectric Project (FERC No. 2790) (Project) located along the Merrimack River in Middlesex County, Massachusetts, and in Hillsborough County, New Hampshire. In support of Project relicensing, Boott is conducting a Whitewater Boating and Access Study in the Project's bypassed reach located in the City of Lowell. On behalf of Boott, we are inviting your participation in an upcoming Whitewater Boating and Access Study Working Group site visit to the Project on August 8, 2019. The site visit is an important component of the study and will be an opportunity to discuss study logistics, volunteer participation, safety, boater access, boatability, flows in the bypassed reach, and survey instruments. Additional details regarding the August 8, 2019 site visit are presented in the attached letter.

Should you have any questions regarding the upcoming site visit, please contact Mr. Kevin Webb, Enel Hydro Licensing Manager, at 978-935-6039 or via email at Kevin.Webb@enel.com.

Thank you,

Robert Quiggle, RPA

Subject: RE: [EXTERNAL] RE: Agenda / Schedule for 2 day FERC Study Plan Work Session

Christine:

Attached is a draft agenda for the proposed two-day workshop in support of the Lowell Hydroelectric Project FERC relicensing. Once you've had a chance to review with your team, we can look to see what dates would make sense. I'd like to try for a mid-October timeframe, as there is a field/site visit component associated with this, and it would probably be better to get that done before things get too snowy/icy.

If you have questions or would like to discuss further, please don't hesitate to call or email me.

Thanks,

Robert Quiggle, RPA

Working Group Participants:

Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the continued operation of the Lowell Hydroelectric Project (FERC No. 2790)(Project) located along the Merrimack River. In support of Project relicensing, Boott is conducting a Whitewater Boating and Access Study as approved in FERC's March 13, 2019 Study Plan Determination for the Project. Pursuant to the approved study plan, Boott met with the Whitewater Boating and Access Study Working Group (Working Group) at the Project on August 8, 2019 to coordinate study planning, identify potential volunteers to participate in controlled flow releases, and to identify potential put-in and take-out locations.

During the August 8, 2019, meeting and site visit, the Working Group indicated a need to visually document a range of flows in the Project's bypass reach in order to assist the participants in identifying which flows to select for the controlled flow releases. Accordingly, Boott has developed the attached Whitewater Flow Documentation Plan that describes the methods for documenting a range of flow conditions in the bypass reach and consulting with the Working Group to identify the appropriate flows for the controlled flow releases.

In order to facilitate implementation of the Whitewater Flow Documentation Plan, Boott is seeking your written (email) concurrence with the proposed plan by November 11, 2019. If you have questions or need additional information, please contact Kevin Webb, Boott Hydro Licensing Manager, at (978) 935-6039 or via email at Kevin.Webb@enel.com.

To: Whitewater Boating and Access Working Group

Re: Lowell Hydroelectric Project (FERC No. 2790-072);
Whitewater Boating and Access Study
Whitewater Flow Documentation Plan

Dear Whitewater Boating and Access Working Group:

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc., is the Licensee and owner of the 20.2 megawatt Lowell Hydroelectric Project (FERC No. 2790) (Project). The Project is located on the Merrimack River in Middlesex County, Massachusetts, and in Hillsborough County, New Hampshire. The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) with an effective date of May 1, 1973. The existing license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process, as described at 18 Code of Federal Regulations Part 5.

In support of Project relicensing, Boott is conducting a Whitewater Boating and Access Study as approved in the Commission's March 13, 2019 Study Plan Determination for the Project. Pursuant to the approved study plan, Boott met with the Whitewater Boating and Access Study Working Group (Working Group) at the Project on August 8, 2019 to coordinate study planning, identify potential volunteers to participate in controlled flow releases, and to identify potential put-in and take-out locations. During the August 8, 2019, meeting and site visit, the Working Group indicated a need to visually document a range of flows in the Project's bypass reach in order to assist the participants in identifying which flows to select for the controlled flow releases. Since the Working Group participants have had limited experience boating the bypass reach, participants could not make informed choices on which flows would be appropriate for boating. Accordingly, Boott has developed the enclosed Whitewater Flow Documentation Plan that describes the methods for documenting a range of flow conditions in the bypass reach and consulting with the Working Group to identify the appropriate flows for the controlled flow releases.

Boott is proposing to document flows in the bypass reach using cellular-enabled trail cameras and to provide the Working Group with a summary report that presents photographs of the bypass reach under various flow conditions. To capture a wide range of flow conditions, Boott is proposing to deploy cellular-enabled trail cameras from approximately December 1, 2019 through May 15, 2020. The cameras will record photos on an hourly basis during daylight hours, and the photographs will be date- and time-stamped. In the summary report, Boott will present representative photographs at approximately 500 cubic feet-per-second (cfs) intervals (e.g., 500 cfs, 1,000 cfs, 1,500 cfs, etc.) along with the corresponding river flow data.

As described in the enclosed plan, Boott will consult with the Working Group based on the Whitewater Flow Documentation Report to determine the appropriate flows for the controlled flow releases. To facilitate the flow documentation and consultation, Boott anticipates conducting the controlled flow releases once the Working Group has had the opportunity to review the Whitewater Flow Documentation Report and after fish passage operations at the Project end around July 15, 2020. The timing of the controlled flow releases will be dependent on available flows in the Merrimack River.

At this time, Boott is seeking your concurrence regarding the Whitewater Flow Documentation Plan and the general schedule for documenting flows and conducting the controlled flow releases. To facilitate timely deployment of the trail cameras, Boott respectfully requests your written (email) concurrence on or

before November 11, 2019. Please send correspondence to the undersigned at the email address provided below.

On behalf of Boott, I look forward to continued discussions and consultation with the Working Group regarding this study. Please do not hesitate to contact me at (978) 935-6039 or via email at Kevin.Webb@enel.com if you have any questions concerning this study or Project relicensing.

Sincerely,
Boott Hydropower, LLC

Kevin M. Webb
Hydro Licensing Manager

1 Introduction and Background

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc., is the Licensee and operator of the 20.2 megawatt (MW) Lowell Hydroelectric Project (FERC Project No. 2790) (Project or Lowell Project). The Project is located along the Merrimack River in Middlesex County, Massachusetts and in Hillsborough County, New Hampshire. Boott owns and operates the Project as an independent power producer.

The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) with an effective date of May 1, 1973. The existing license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process (ILP), as described at 18 Code of Federal Regulations (CFR) Part 5. As proposed in Boott's January 28, 2019 Revised Study Plan (RSP) and approved in the Commission's March 13, 2019 Study Plan Determination (SPD), Boott will conduct a Whitewater Boating and Access Study (Study) in support of Project relicensing.

1.1 Whitewater Boating and Access Study Overview

The Lowell Project is a run-of-river hydropower plant. When river flows exceed the hydraulic capacity of the two generating units located at the E.L. Field Powerhouse (combined capacity of approximately 8,000 cubic feet per second [cfs]), excess flows (up to approximately 2,000 cfs) are routed through the downtown Lowell canal system and through the canal units. When inflows exceed the 10,000 cfs capacity of the generating units and canals, all excess flows are passed over the Pawtucket Dam spillway into the bypass reach. The Project has the potential to affect whitewater boating opportunities in the bypass reach when flows are less than 10,000 cfs.

As described in the approved Revised Study Plan, the goal of the Study is to assess the Project's bypass reach for whitewater boating and access opportunities. The objectives of the study are as follows:

- Assess a range of flows suitable for whitewater boating opportunities in the Project's bypass reach;
- Assess the frequency, timing, duration, and predictability of paddling flows under current and proposed Project operations;
- Define potential locations for put-in and take-out points for boaters; and,
- Assess the flow information needs for whitewater boating and the current and potential flow information distribution system.

In accordance with the approved study plan, Boott met with the Whitewater Boating and Access Study Working Group (Working Group) at the Project on August 8, 2019 to coordinate study planning, identify potential volunteers to participate in controlled flow releases, and to identify potential put-in and take-out locations.

During the August 8, 2019, meeting and site visit, the Working Group indicated a need to visually document a range of flows in the Project's bypass reach in order to assist the participants in identifying which flows to select for the controlled flow releases. Since the Working Group participants had limited experience boating the bypass reach, participants could not make informed choices on which flows would be appropriate for boating. Accordingly, Boott has developed this Whitewater Flow Documentation Plan that describes the methods for documenting a range of flow conditions in the bypass reach and consulting with the Working Group to identify the appropriate flows for the controlled flow releases.

2 Methodology

To document the whitewater conditions in the bypass reach under various flows, Boott proposes to deploy cellular-enabled trail cameras to capture time- and date-stamped images of the bypass reach on an hourly basis during daylight hours.

In general, the average flows at the Project from June through February are within the operating range of the Project's E.L. Field Powerhouse and the units along the downtown canal system; however, seasonal high water events (in excess of 10,000 cfs) do occasionally occur in the late fall. Boott also maintains flows in the canal system to facilitate National Park Service (NPS) boat tours from May 15 through October 15, annually[1]. Therefore, to capture flows in the bypass reach during months where higher flows typically occur (March through May), and to document a broad range of flow conditions, Boott is proposing to deploy cellular-enabled trail cameras from approximately December 1, 2019 through May 15, 2020.

Boott will deploy cellular-enabled trail cameras at four locations along the bypass reach to capture images of different sections of the reach under the various flows conditions. As shown below in Figure 2-1, Boott is proposing to deploy cameras at the following four locations:

- The Fish Ladder at the Pawtucket Dam;
- A location along the bypass reach located upstream from the University Avenue Bridge;
- A location along the bypass reach located downstream from the University Avenue Bridge; and
- The E.L. Field Powerhouse.

To verify the flows represented by the photographs, Boott will use Project operations data in combination with U.S. Geological Survey (USGS) information. There is an

[1] Although there is no formal flow requirement for the canal system, Boott maintains an operating agreement with the NPS to allow tour boat operations to navigate the canal system. Boott maintains canal water levels within appropriate limits during the May 15 to October 15 tour boat operating season. Operations are maintained through a series of locks and gatehouses along the Canal System

existing USGS gage installed approximately 2.1 miles downstream from the Pawtucket Dam (USGS No. 01100000, Merrimack River BL Concord River at Lowell, MA). There is also an existing USGS gage installed on the Concord River (USGS No. 01099500, Concord R below R Meadow Brook, at Lowell, MA). Flows from the USGS Gage No. 01099500 will be subtracted from the flows at USGS Gage No. 01100000 to calculate flows at the Project. Flows in the bypass can be estimated by applying the weir formula to the depth of flow over each crest gate zone (plus any flow provided via the fish ladder). Bypass flows can also be estimated by subtracting the sum of flow at the E.L. Field Powerhouse and through the canal system from the inflow calculated from the USGS gages as described above.

3 Consultation with Working Group

Boott will prepare a summary Whitewater Flow Documentation Report that provides photographic documentation of a range of flows in the Project's bypass reach. Boott anticipates providing images and verified flows in intervals of approximately 500 cfs (e.g., 500 cfs, 1,000 cfs, 1,500 cfs, etc.). Boott also intends to provide images of verified flows at the lowest and highest flows observed from December 1 through May 15. Once the Working Group has had the opportunity to review the Whitewater Flow Documentation Report, Boott anticipates conducting the controlled flow releases after fish passage operations end around July 15, 2020, to avoid any interference with fish passage studies scheduled for the Spring/Summer 2020 fish passage season.

Based on the information presented in the Whitewater Flow Documentation Report, Boott will consult with the Working Group to select the controlled releases to be provided during the Study in 2020. The timing of the controlled flow releases will be dependent on available flows in the Merrimack River. Each of the controlled releases will be provided for approximately 3 hours. This will afford participants the opportunity to boat the reach and make multiple passes at each flow so that participants are able to evaluate different lines through various portions of the study reach. Pre, post, and comparative surveys will be provided to controlled flow release participants for their completion during this portion of the study (draft pre, post, and comparative surveys can be found in Appendices D through F of the RSP).

Subject: Lowell Hydroelectric Project (FERC No. 2790) Study Workshop
Attachments: November 2019_Lowell Hydro Project Workshop Agenda.pdf

Dear Stakeholders:

Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the continued operation of the Lowell Hydroelectric Project (FERC No. 2790)(Project) located along the Merrimack River. In support of Project relicensing, Boott is conducting a Recreation and Aesthetics Study, a Historically Significant Waterpower Equipment Study, and a Water Level and Flow Effects on Historic Resources Study, as approved in FERC's March 13, 2019 Study Plan Determination for the Project. Boott intends to hold a two-day Lowell Hydroelectric Project Study Workshop (Workshop) with interested stakeholders to address data needs and conduct a Project site visit related to the above studies.

The Workshop will be held in Lowell, MA over two days in November 2019. The first day will focus on stakeholder consultation, information gathering, and data needs for the three studies mentioned above. Boott anticipates this first day will take place from 9am-4pm in Lowell, MA. Additional details regarding the meeting space to follow. The second day will consist of a site visit to target specific Project facilities associated with the studies.

Boott is proposing the following dates for the two-day Workshop:

November 12-13, 2019
November 13-14, 2019
November 14-15, 2019
November 19-20, 2019

Please notify Boott of the dates you can attend the Workshop by completing the poll here: https://www.surveymonkey.com/r/YQFX7LD . Boott has developed the attached Lowell Hydroelectric Project Study Workshop Agenda. In order to facilitate the scheduling of the Workshop, Boott is asking that all interested stakeholders complete the poll by November 6, 2019. If you have questions or need additional information, please contact Kevin Webb, Boott Hydro Licensing Manager, at (978) 935-6039 or via email at Kevin.Webb@enel.com.

Thank You –

Kelsey,
I'm writing because the NPS blocked my access to your poll. My participation would be most useful for the first day, not the site visits. Days I'm available for the day 1 workshop are November 12 or November 13, so either of the first two options are good for me. Thanks.

> Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the continued operation of the Lowell Hydroelectric Project (FERC No. 2790)(Project) located along the Merrimack River. In support of Project relicensing, Boott is conducting a Recreation and Aesthetics Study, a Historically Significant Waterpower Equipment Study, and a Water Level and Flow Effects on Historic Resources Study, as approved in FERC's March 13, 2019 Study Plan Determination for the Project. Boott intends to hold a two-day Lowell Hydroelectric Project Study Workshop (Workshop) with interested stakeholders to address data needs and conduct a Project site visit related to the above studies.

The Workshop will be held in Lowell, MA over two days in November 2019. The first day will focus on stakeholder consultation, information gathering, and data needs for the three studies mentioned above. Boott anticipates this first day will take place from 9am-4pm in Lowell, MA. Additional details regarding the meeting space to follow. The second day will consist of a site visit to target specific Project facilities associated with the studies.

Boott is proposing the following dates for the two-day Workshop:

November 12-13, 2019

November 13-14, 2019

November 14-15, 2019

November 19-20, 2019

Please notify Boott of the dates you can attend the Workshop by completing the poll here: https://www.surveymonkey.com/r/YQFX7LD . Boott has developed the attached Lowell Hydroelectric Project Study Workshop Agenda. In order to facilitate the scheduling of the Workshop, Boott is asking that all interested stakeholders complete the poll by November 6, 2019. If you have questions or need additional information, please contact Kevin Webb, Boott Hydro Licensing Manager, at (978) 935-6039 or via email at Kevin.Webb@enel.com.

Agenda

Project:	Lowell Hydroelectric Project (FERC No. 2790)
Date/Time:	TBD
Location:	Lowell National Historic Park, Lowell MA
Subject:	**Lowell Hydroelectric Project Study Workshop**

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc., is the Licensee and owner of the 20.2 megawatt Lowell Hydroelectric Project (FERC No. 2790) (Project). The Project is located on the Merrimack River in Middlesex County, Massachusetts, and in Hillsborough County, New Hampshire. The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) with an effective date of May 1, 1973. The existing license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process, as described at 18 Code of Federal Regulations Part 5.

In support of Project relicensing, Boott is proposing to hold a two-day study workshop in Lowell, MA to consult with the National Park Service (NPS), Massachusetts Department of Conservation and Recreation (MADCR), City of Lowell (City), and other partners regarding certain studies approved in the Commission's March 13, 2019 Study Plan Determination for the Project. As described in the approved study plan, Boott is seeking information from the NPS, MADCR, and other partners regarding the Recreation and Aesthetics Study, the Historically Significant Waterpower Equipment Study, and the Water Level and Flow Effects on Historical Resources Study. The proposed two-day workshop will be an opportunity for consulting parties to share information and to identify the specific focus for field activities.

Day One: Data Needs and Information Gathering

The first day of the proposed workshop is intended to allow Boott, the NPS, MADCR, City, and other participating parties to discuss data needs and review available documentation. A proposed agenda for this day one of the workshop is presented below.

1. **Introduction**

    - Welcome and introduction
    - Overview and status of FERC relicensing process

2. **Recreation and Aesthetics Study**

    Study-specific Data Needs and Information Gathering

    - Recreation opportunities and access along the canal system;
    - Future use or planning documents that address anticipated or desired changes to the Lowell National Historic Park and Lowell Heritage State Park (e.g., The Foundation Report, or 5-year and 10-year plans);
    - Documentation of any reoccurring public safety issues or incidents within the parks associated with the canal infrastructure related to public recreation;
    - Annual maintenance schedules for the canal system;
    - Management or operations plans for the parks; and
    - Annual use records.

3. **Historically Significant Waterpower Equipment Study**

Study-specific Data Needs and Information Gathering

- Historically significant waterpower equipment owned and operated by Boott Hydropower of interest to the NPS for potential future interpretation, exhibition, or as scrap equipment to maintain and operate other historic machinery;
- Engineering reports, drawings, and/or photographs related to historically significant waterpower equipment owned and operated by Boott Hydropower of interest to the NPS; and
- Components of historically significant waterpower equipment owned and operated by Boott Hydropower that will require photography and documentation.

4. **Water Level and Flow Effects on Historic Resources Study**

Study-specific Data Needs and Information Gathering

- Engineering reports or evaluations of historic canal structures, including documentation of previous maintenance and/or repairs related to canal water levels;
- Descriptions and/or photographs of properties that have been previously affected by canal operations; and
- Engineering and architectural drawings, maintenance records, and structural modifications of the Great River Wall.

5. **Action Items and Next Steps**

Day Two: Site Visit

Day two of the proposed workshop is focused on a site visit at the Project. The purpose of the site visit is to view locations identified during day one of the workshop, including:

- Areas of potential recreation enhancements and potential recreational access areas;
- Historically significant waterpower equipment selected by the NPS for documentation, including specific equipment to be photographed;
- Canal features that have been previously impacted by flows and water levels; and
- Areas along the canal system where waterborne trash collects.

RE: NPS Response to Whitewater Boating and Access Study
Whitewater Flow Documentation Plan
Boott Hydropower, LLC
Lowell Hydroelectric Project, FERC No. 2790-072
Merrimack River, Middlesex County, MA, and Hillsborough County, NH

Thank you for providing an opportunity to comment on the Whitewater Flow Documentation Plan. Upon review, Lowell National Historical Park staff do not have comments for the proposed methodology to identify target flows. We do have questions and comments relating to data collected during the controlled flow releases in the study period.

NPS Boat Tours and Northern Canal Walkway

Page 2: We greatly appreciate that you have noted the arrangement between Boott Hydropower, LLC and the National Park Service (NPS) in regard to NPS boat tours and have planned study parameters with this operation in mind. Please also note that public access to the Northern Canal Walkway is dependent on flow conditions in the Merrimack River being under 3500 cubic feet per second (CFS). The normal operating season for the Northern Canal Walkway is also May 15-Oct 15. There is strong public support for increasing walkway access through longer daily hours and/or lengthening the operating season.

Controlled Flow Releases for Whitewater Rafting

Page 3: In regard to the controlled flow releases to be performed around July 2020 for the study:

1. How far up and downstream will flows in the Merrimack River and Canal System be affected by controlled flow releases at the dam? How will the Whitewater Boating and Access Study monitor flow impacts outside of the bypass reach? Please note:
    a. Merrimack River flow rate must be under 18,500 CFS for NPS to operate education programs on a river boat along the Merrimack River. NPS offers river boat education programs annually May 1 through October 15.
    b. Merrimack River flow must be under 12,500 CFS for NPS canal boats to enter Merrimack River from Pawtucket Canal. The NPS canal boat operating season occurs annually May 15 through October 15.
    c. Merrimack River flow rate must be under 3500 CFS to open the NPS Northern Canal Walkway. The operating season for the Northern Canal Walkway is May 15 through October 15. There is strong public support to increase the operating season for this walkway.
    d. With the Pawtucket Dam measured at 0'0", if water level readings at Francis Gate go below 1'0" canal boats cannot navigate through lock chamber at Francis Gate as boat engines will run into ground on granite ledge upstream of Francis Gate. If water level readings are above 6'0", boats cannot fit under Pawtucket Street Bridge. The NPS canal boat operating season occurs annually May 15 through October 15.
2. Would controlled flow releases impact water flow and/or fish access to the fish ladder? How will this be monitored in the study period?
3. Could controlled flow releases cause scour conditions or other negative impacts to historic properties, particularly along the foundation wall of the Northern Canal/Pawtucket Gatehouse and the Great Wall separating the Northern Canal from the Merrimack River? How will this be monitored in the study period?

We appreciate the opportunity to assist Enel in the development, conduct and evaluation of the Whitewater Boating and Access Study.

Sincerely,

Celeste Bernardo

Celeste Bernardo,

Superintendent, Lowell National Historical Park

Kelsey and Kevin,

I don't see the "Resources, Ownership, Boundaries, and Land Rights Study" on the agenda. City, DCR, NPS are very invested in the success of that study. We're hoping it can serve as the basis for a new MOU among parties for maintenance and canal stewardship. Could you add it to the agenda as item 2 or 3? We can host this size of group in our Visitor Center (246 Market Street). Meeting attendees can park for free in our visitor center parking lot.

Subject: Update - Lowell Hydroelectric Project (FERC No. 2790) Study Workshop

Dear Stakeholders –

Due to scheduling conflicts, Boott is resurveying this group for available dates to hold the two-day Lowell Hydroelectric Project Study Workshop (Workshop) with interested stakeholders. The first day of the Workshop will focus on stakeholder consultation, information gathering, and data needs. Boott anticipates this first day will take place from 9am-4:30pm in Lowell, MA. Additional details regarding the meeting space to follow. The second day will consist of a site visit to target specific Project facilities.

Boott is proposing the following dates for the two-day Workshop:

December 4-5, 2019
December 5-6, 2019
December 9-10, 2019
December 10-11, 2019
December 11-12, 2019
December 17-18, 2019
December 18-19, 2019

Please notify Boott of the dates you can attend the Workshop by completing the Doodle Poll here: https://doodle.com/poll/dp2qb9232aq66awg

In order to facilitate the scheduling of the Workshop, Boott is asking that all interested stakeholders complete the poll by November 13, 2019. If you have questions or need additional information, please contact Kevin Webb, Boott Hydro Licensing Manager, at (978) 935-6039 or via email at Kevin.Webb@enel.com.

Agenda

Project:	Lowell Hydroelectric Project (FERC No. 2790)
Subject:	Lowell Project Study Workshop & Site Visit
Date:	December 18 – 19, 2019
Location:	Lowell National Historical Park Visitor Center (246 Market Street), Lowell, MA.

Pursuant to the Federal Energy Regulatory Commission's (FERC or Commission) Study Plan Determination (SPD) for the relicensing of the Lowell Hydroelectric Project (FERC No. 2790) (Project), Boott Hydropower, LLC (Boott) will conduct a Recreation and Aesthetics Study, a Water Level and Flow Effects on Historic Resources Study, and a Historically Significant Waterpower Equipment Study (collectively Studies). This Study Workshop to consult with stakeholders regarding these Studies will be held from 9:00 AM until 4:00 PM at the Lowell National Historical Park Visitor Center (246 Market Street) in Lowell, MA. The adjacent parking at 304 Dutton Street is free. On the following day after the Study Workshop, stakeholders are invited to participate in a site visit of the Project to consult on the field portion of the Studies, which is expected to end at noon. The proposed agenda for the Study Workshop is as follows:

Welcome and Introductions ..... 9:00 AM – 9:30 AM

Discussion of FERC Relicensing and ILP Study Process ..... 9:30 AM – 10:00 AM

Break ..... 10:00 AM – 10:15 AM

Recreation and Aesthetics Study Needs ..... 10:15 AM – 11:15 AM

Water Level and Flow Effects on Historic Resources Study Needs ..... 11:15 AM – 12:00 PM

Lunch Break ..... 12:00 PM – 1:00 PM

Historically Significant Waterpower Equipment Study Needs ..... 1:00 PM – 2:00 PM

Open discussion/Break ..... 2:00 PM – 3:00 PM

Upcoming ILP Schedule (2020-2021) ..... 3:00 PM – 3:30 PM

Action Items and Next Steps ..... 3:30 PM – 4:00 PM

Stakeholders –

There is strong interest in discussing the Resources, Ownership, Boundaries, and Land Rights Study that is being performed as part of the relicensing of the Lowell Hydroelectric Project. Boott added the study to the agenda for the upcoming Study Workshop on December 18, 2019. Please see the attached updated agenda (the most recent version) and we look forward to seeing you next week.

Should you have any questions about the Study Workshop, please contact me at the phone number or email address below, or contact Mr. Kevin Webb, Enel Hydro Licensing Manager, at 978-935-6039 or via email at Kevin.Webb@enel.com.

Subject: Lowell NHP Exotic Species Treatment Schedule - Vegetation Mgmt
Attachments: 2018.9.11 EXOTIC SPECIES TREATMENT LOWELL.docx

Hi folks,

Thank you so much for hosting a meeting with the canal stewardship partners. I'm attaching a document from our maintenance department which outlines the exotic species that exist along the canals and treatment schedules.

Christine Bruins | Community Planner
Lowell National Historical Park
978.275.1726 (office) | 978.954.1011 (cell)

EXOTIC SPECIES TREATMENT CALENDAR FOR LOWELL NATIONAL HISTORICAL PARK

Prepared by Lars Boyd, Sept 11, 2018.

OUTLINE

I. Purpose of document

II. Target species for 2019

III. Tentative Treatment Calendar

IV. Best Management Practices

V. Brief description of each species with photos and treatment strategies

I. PURPOSE

This document provides a series of tables and exotic plant management information to aid in organizing of a 2019 treatment schedule for Lowell NHP.

This document will present an appropriate species to be focused on in a park for the given, and a potential control method. Often other species may be treated at the same time as the target species if the appropriate treatment method is able to be performed concurrently. For foliar spraying, a generic herbicide mixture can be used to treat a broad spectrum of species within the same day. A generic herbicide mixture can be applied to multiple species for basal bark and cut stem/stump treatments as well. Refer to the individual species treatment guides (Table 6-13) to determine if the application method is appropriate within the given time window before treating other species in the area with herbicide.

II. TARGET SPECIES FOR 2019 LOWELL NHP

Table 1: Reported Target Species W/ Locations for FY 2019

Species	NCW	BSS	FG	SW/JS	DSC&T	KP	VCC	TT	KSH	WCW
Ailanthus altissima (Tree of Heaven)	X		X		X					X
Alliaria petiolata (Garlic mustard)		X	X	X		X			X	
Celastrus orbiculatus (Asiatic Bittersweet)	X		X		X	X				X
Convolvulus arvensis (Bind Weed)										X
Cynanchum louiseae (Black Swallow-wort)	X			X	X	X	X	X		X
Fallopia japonica (Japanese Knotweed)		X		X	X					
Lythrum salicaria (Purple Loosestrife)	X			X						X
Rosa multiflora (Multiflora Rose)										X

NCW- Northern Canal Walkway
BSS- Black Smith Shop
FG- Francis Gate
SW/JS- Swamp Locks/Jackson St
DSC&T- Dutton St Canal & Tracks
KP- Kerouac Park
VCC- Visitor Center Courtyard
TT- Tremont St Tracks
KSH- Kirk St Headquarters
WCW- Western Canal Walkway

III. TENTATIVE CALENDAR FOR LOWELL NHP EXOTIC PLANT REMOVAL

Table 2: Foliar Spray Treatment Sequencing

Species	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV
Rosa multiflora (Multiflora Rose)			X	X					
Ailanthus altissima (Tree of Heaven)				X	X	X			
Cynanchum louiseae (Black Swallow-wort)				X	X				
Convolvulus arvensis (Bindweed)					X	X	X		
Fallopia japonica (Japanese Knotweed)						X	X		
Lythrum salicaria (Purple Loosestrife)						X			
Alliaria petiolata (Garlic mustard)							X	X	
Celastrus orbiculatus (Asiatic Bittersweet)								X	X

IV. BEST MANAGEMENT PRACTICES (ADOPTED FROM THE EXOTIC SPECIES TREATMENT CALENDAR FOR BOSTON METROPOLITAN PARKS by Lyndon Langthorne)

Non-chemical Treatment

Non-chemical treatment, when appropriate for the target species, should be attempted before chemical treatment. In most situations, chemical treatment can be made more effective when applied in conjunction with non-chemical management strategies. Non-chemical management strategies are generally labor intensive, but can be performed in most areas, including areas where chemical treatment would not be advisable.

Table 3. Non-chemical Treatment Methods

Hand pulling	Manual removal of top growth of plant, and as much of the root system as possible. Extensive, deep, and large root systems are not removable by hand. Hand pulling will prevent the formation of seed pods if consistently implemented throughout the growing season. This method is often not effective in managing regenerative species. Rhizomatous species are not generally manageable through this strategy alone.
Digging	Manual or mechanical removal of root system when hand pulling alone is not sufficient in removing the root system. Species that re-

	sprout from roots must have the root system removed. Digging is labor intensive. This method is not viable when managing regenerative plants with extensive, deep, or large roots. Digging disturbs the soil, encouraging colonization by other exotic species.
Cutting	Manual removal of the entire top growth of the plant by cutting the stem close to the ground. Plant matter removed by cutting may, depending on the species and desired conditions, be allowed to compost (either where it is cut or moved to another location), or destroyed to prevent reshooting of roots. Cutting can be effective on annuals or biennials if done before seeding, but in most perennial species, cutting alone is not capable of achieving control. Stump grinding of larger, woody stumps can prevent reshooting (e.g. *F. alnus*, *R. cathartica*, *A. altissima*). Herbicide can be applied to the cut surface to destroy the roots and prevent reshooting.
Flower clipping / Seed-heading	Manual removal of flowers or seed heads to prevent seeding or seed spread, but not removal of the plant top growth; seeds collected are destroyed. This method will limit the ability of the plant to spread through seeding, but will not prevent vegetative spread by the root system. Some plants do not rely on seeds as the primary vector of spread (e.g. *F. japonica*).
Mulching / Mats / ”Buckthorn Bags”	Covering of a disturbed or treated area to limit the ability of exotic species to grow and recolonize an area. Mulch can be layered over soil, and possible supplemented with a permeable material, like cloth or paper, to limit the ability of exotics to reshoot while also providing an area that can be used for planting. Reshooting may still occur with mulch, and monitoring is advisable. Mats of rubber or black plastic can be layered on the soil as an impervious surface. This surface cannot be used for planting, but is more likely to prevent any regrowth. If the mats are in an area of direct or partial sunlight, the heat collected will kill covered roots. “Buckthorn bags” can be placed over stumps of *F. alnus* and *R. cathartica* that are over two inches in diameter. Left in place for two years, these bags will prevent regeneration and destroy the root system of the plant.
Mowing	Mechanical removal of top growth of plants. Able to be applied quickly to large areas. Mowing is less precise than most manual methods, and is most viable on land that is already managed land. Will not destroy the root system of most plants, but often stresses the plant and prevents seed production if done consistently. Herbicide applied after mowing will often be more effective, either applying immediately after mowing as cut stem/stump treatment, or upon regrowth as a foliar spray.

Stump grinding	Perennial shrubs and trees can have their stumps ground to prevent reshooting.

Seeds forming on exotic plants should always be removed when observed. Removal of seeds can be a valuable management strategy in areas of lower priority, or where other management strategies are inadvisable. Seed removal will not disrupt existing plants, but will limit growth and spread of these populations. Seed removal also prevents exotics from further contributing to the soil seed bank, all the viable seeds existing within the soil of an area. Seeds of exotics should be burned or bagged and disposed of in a landfill to prevent further contamination.

Bare patches of soil, particularly those remaining after soil is disturbed by digging or hand pulling, is vulnerable to colonization by new exotic species. To mitigate this threat, new plants and grasses should be added to bare areas whenever possible. If a bare patch was the site of chemical treatment that will be repeated the following year, seed of an inexpensive annual ryegrass can be planted to limit the cost of further chemical treatments.

Chemical Treatment

Use pesticides at rates recommended by the label, and never exceed labeled rates. Mitigate damage to other plants and ecosystems by taking care for herbicide drift. Only apply herbicides on calm, dry days, and never any closer to standing water than is specified on the label. Herbicide applicators should always be properly fitted with Personal Protective Equipment (PPE) required by label, which represents the **minimum** PPE required for use. When applying chemicals, it is advisable to add a dye to the mix, unless otherwise stipulated, to better mark which plants have been treated. Dyes also allow contaminated gear to be easily identified for safety reasons.

Table 4. Chemical Treatment Method Overview

Foliar Spray	Broadcast or spot application of herbicide with a sprayer targeting foliage of species, wetting the leaves with herbicide to be absorbed into the root system. Apply to intact, green leaves. This is often the most efficient herbicide application method. Lower concentrations are used with foliar spray than other application methods. Foliar spray has the greatest potential to unintentionally damage surrounding plants, and may not be preferred for this reason. Foliar application is best for treating large, dense stands of invasive plants where risk of damaging surrounding plants can be minimized. When spraying, herbicide should wet leaves without dripping, as excessive spraying can harm non-target species. The extent of the application depends on the size of the area being treated. Spot spraying is application of herbicide in one location,

	generally to one plant. This type of application minimizes damage to surrounding plants. Broadcast application is more extensive than spot spraying for heavier infestations. Foliar spraying should not be performed on wet weather days as any herbicide may not be absorbed into plants, instead being washed away as runoff. Foliar spraying should not be performed on days when wind speeds are greater than 5 mph to prevent pesticide drift. Foliar spraying should also not be performed in areas where damage to non-target species is a concern. Large trees should not be treated by foliar spray.
Cut Stem/Stump	Application of herbicide either by brush or spray bottle to a cut surface to be absorbed into the root system. After cut, herbicide should be applied to the cut surface immediately for best effect, and not more than 15 minutes later; this time limit is particularly important for the best absorption of water-based herbicides, and oil based herbicides can be applied longer after cutting. Cut stump applications are more effective than basal bark on woody stems greater than 5” diameter, and thick barked species.
Basal Bark	Application of herbicide to the bark with a sprayer, from surface to 12-18 inches above the root collar, to be absorbed into root system. Useful in precisely controlling woody species. Treatment can be performed while herbaceous species are dormant. Uses oil-based herbicides that penetrate bark, mixed with a carrier (basal oil). The entire surface area of the trunk should be coated within the 12-18 inch range, and rough bark requires more spray. Application should be stopped short of runoff.
Stem Injection	Application of herbicide into the stems of hollow plants via specialized injection equipment. This method ensures absorption of the herbicide into the roots of the plant, and limits exposure to and contamination by pesticides.
Hand Wicking (“Glove of death”)	Application of herbicide to the leaf surface with an absorbent cotton glove coated in herbicide layered over a chemical resistant glove. Small spray bottles are used to wet the fingertips and palm of the glove, which is then wiped directly on the plant, coating the leaves. This method is precise, faster than cut stem/stump treatment, and limits exposure of herbicide to other plants. Cuff the ends of the glove to prevent dripping. Gloves used for this method will becomes saturated with herbicide and should not be stored with other equipment.

Herbicides

Use with caution.
Be aware of local regulations before use.
Always read the label thoroughly before use, and follow all requirements (including PPE, site location, concentration, etc.).

Chemicals should be chosen based on a variety of factors, including: effectiveness on target species, environmental impact (toxicity to animals, persistence in soil, activity in water), and safety. The correct herbicide should be chosen for the site, and herbicide labelling will list use sites.

Table 5. General Overview of Commonly Used Herbicides

Glyphosate	**(*Rodeo®*)**	Glyphosate is a non-selective systemic post-emergent herbicide, damaging to most plants, including broadleaf plants and grasses. Pure glyphosate is generally environmentally safe, essentially non-toxic to mammals and fish, and mildly toxic to birds. Glyphosate is quickly absorbed into soil, and has negligible lasting environmental effects, and leaching to other areas is not expected to occur. Glyphosate has a short half-life in soil and water. Glyphosate may or may not be metabolized by plants, and potentially persists in plants where it was applied, including in the roots. Be aware that not all glyphosate herbicides are registered for aquatic use, and some formulations are contain adjuvants that make them highly toxic to aquatic life. If using in an aquatic area, be sure to use a product that omits these toxic ingredients (eg. *Rodeo®*). Pure glyphosate has low human toxicity, but is often made more hazardous to humans with adjuvants that disseminate the chemical into plants. Causes significant eye irritation.
Triclopyr amine	**(*Garlon® 3A*)**	Triclopyr is a selective systemic post-emergent herbicide. It is relatively non-toxic to humans and terrestrial mammals, and some formulations are registered for aquatic use. Triclopyr should generally be used in areas where it is desired to protect surrounding grasses and sedges. Triclopyr amine is preferred for foliar applications over triclopyr ester.

Triclopyr ester	**(*Garlon® 4 Ultra)***	Triclopyr is a selective systemic post-emergent herbicide. It is relatively non-toxic to humans and terrestrial mammals. It is not registered for aquatic use. Triclopyr ester is only recommended as a foliar spray prior to full leaf-out of the target plant. After leaf out, other herbicides would be preferred. Good for basal barking when mixed with a basal oil. Cannot be used within 35 ft. of wetland.
Imazapyr	**(*Plateau®, Habitat®*)**	Imazapyr is a non-selective, systemic, pre- and post-emergent herbicide. Imazapyr formulations can be registered for aquatic use. Imazapyr has a low human toxicity in skin contact or if ingested. Harmful if inhaled and may cause irreversible eye damage.

A good strategy for foliar application efficiency is to mix a general formulation of triclopyr amine and glyphosate. This mixture can be applied on a wide spectrum of species, and allow more treatment to occur during a single application session.

V. BRIEF DESCRIPTION OF EACH TARGET SPECIES (ADOPTED FROM THE EXOTIC SPECIES TREATMENT CALENDAR FOR BOSTON METROPOLITAN PARKS by Lyndon Langthorne)

Ailanthus altissima (Tree of Heaven)

Description

https://www.extension.iastate.edu/forestry/iowa_trees/trees/tree_of_heaven.html

A. altissima is a large non-native short-lived deciduous perennial tree. The trunk grows up to eighty feet tall, and is straight and gray, with smooth to bumpy bark that fissures with age. Leaves are silvery-green and pinnately compound, with alternate leaflets on one to four foot leaf veins. Leaves produce a foul smell if crushed. Five-petaled flowers are small, yellow-green, and grow in dense clusters. Reddish-brown seed pods are produced in late summer, and are twisted like helicopters, each containing one seed

The tree is resilient, and will grow in a wide range of environments, including urban where the root system can disrupt hardscaping and cause damage to structures. *A. altissima* crowds out native trees quickly with its ability to spread quickly to new areas. The roots are toxic and may limit growth potential for native plants.

Non-chemical Treatment

Seedlings and root suckers should be dug consistently to control spread. Any remaining stumps and roots will continue to generate new shoots. Cutting and mowing alone are not an effective form of management, and may increase density and spread potential. Mechanical measures that remove top growth are most effective when followed up by chemical treatment.

Chemical Treatment

Foliar spraying is the most common form of treatment for *A. altissima*] Foliar treatment best applied between full canopy and fall color. Foliar application cannot be applied to larger trees, and is most effective in treating dense stands of saplings.

Cut stump treatment is a more labor intensive method, but may be necessary in treating larger trees. After cutting tree, immediately apply herbicide to cut surface. Cutting alone will lead to increased suckering, and should be mitigated with herbicide application

Basal bark used for follow up treatments or small infestations. Root injury is maximized when used after full canopy to fall color. Following basal bark treatment, the tree is left in place to be cut at a later time. *A. altissima* may require multiple applications.

To maximize root damage, any chemical treatment should be performed within the time window where the tree has developed its full canopy and before the leaves have turned to fall colors.

Table 6: *A. altissima* Treatment Guide

Application Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Hand pulling					Apr - Jun	Seedlings and saplings
Chemical Treatment						
Foliar	Glyphosate	*Rodeo®*	Non-selective	2%	Late Jun - Aug	Surfactant
	Triclopyr	*Garlon® 3A*	Selective	2%		
		Garlon® 4 Ultra		1.5%		
	Imazapyr	*Habitat®*	Non-selective	1%		
Cut stem/stump	Triclopyr	*Garlon® 3A, Garlon® 4 Ultra*	Selective	50%	Late Jun - Aug	
Basal bark	Triclopyr ester	*Garlon® 4 Ultra*	Selective	20-25%[1]	Mar - Oct[1]	Basal oil

***Alliaria petiolata* (Garlic Mustard)**

Description

https://www.michigan.gov/invasives/0,5664,7-324-68002_71240_73853-379483--,00.html

A. petiolata is a non-native biennial herb. First year plants are immature and resemble many native plants, such as *Viola*. In its first year leaves stay green all year long. *A. petiolata* is much easier to identify in the second year after bolting. In the second year, the leaves take on a garlicky odor and the stem forms up to three feet in height. Leaves are alternate, sharply toothed, and triangular. Flowers bloom early in the season and are white with four petals. Seed pods develop atop the stem and burst to project seeds up to five feet from the plants, leading to rapid expansion of patches. *A. petiolata* produces more seeds in wet environments.

A. petiolata populations can grow rapidly when unchecked. Roots of *A. petiolata* have an allelopathic effect on native plants, limiting growth potential in areas of infestation. The plant provides no benefits as a food source for native animal species.

Non-chemical Treatment

Stems are attached to a single root, and plants can be removed entirely by pulling, particularly in moist and loose soil. Plants can also be dug. These methods can be an effective for control, but disturbs soil and leaves bare patches, which can be recolonized. Roots must be removed completely to prevent resprouting and are easily broken.

Mowing or cutting of *A. petiolata* in its second year after bolting can also be an effective management strategy, destroying plants, especially those already under stress, and preventing seed development.

Clipping and removing of flowers will prevent the formation of new seeds, and will reduce population growth rates.

These methods must be repeated over many years until seed bank is depleted. Size of the seed bank depends on the age of the population. When utilizing these methods, it is important to clean any equipment used or worn in order to prevent seed spread.

Chemical Treatment

Foliar spray is the recommended method for chemical treatment of A. petiolata, if chemical treatment is deemed necessary. Leaves should be cleaned of debris prior to application to ensure absorption into the plant. Glyphosate and triclopyr amine application to rosettes is most effective in late fall, and is best used only on dense stands where non-chemical treatment would be prohibitively laborious. Triclopyr amine can be used to avoid damaging surrounding grasses.

Table 7. *A. petiolata* Treatment Guide

Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Hand pulling					Apr - Oct	
Mowing					Aug - Oct	Most effective if plants are already under stress (drought, etc.)
Flower clipping					Apr - Jun	
Chemical Treatment						
Foliar spray	Glyphosate	*Rodeo®*	Non-selective	0.5-1%[1]	Sep - Oct	
	Triclopyr amine	*Garlon® 3A*	Selective	0.5-1%[1]		

Notes:
1. Contributed by BM

Celastrus orbiculatus (Asiatic Bittersweet)

Description

C. orbiculatus is a non-native deciduous woody perennial that grows as either a vine or a shrub. Stem is woody with smooth brown bark. Leaves are alternate, glossy, and round with a pointed tip and shallow toothed margins. The leaves grow from two to five inches in length. Small greenish-yellow flowers with five petals form at leaf axils in clusters. Fruits are distinctive, in round orange capsules that split open in fall revealing fleshy red fruits with one or two seeds each.

https://orleansconservationtrust.org/asiatic-bittersweet-celastrus-orbiculatus/

The fruits persist throughout winter, and are highly attractive to birds and other animals, and to humans who often use vines and fruits in decorative manners. *C. orbiculatus* can spread far as seed, and is also capable of root suckering.

C. orbiculatus looks very similar to *C. scandens* (American Bittersweet), particularly when young. As the plant matures, it distinguishes itself with the placement of the fruit: *C. scandens* develops fruit on the tips of its branches, whereas *C. orbiculatus* develops fruits on the leaf axils. *C. scandens* leaves are also less round. Hybridization makes identification difficult. *C. orbiculatus* may be sold as *C. scandens* due to the difficulty in identification.

C. orbiculatus displaces native species through competition, and also displaces *C. scandens* through hybridization, potentially threatening *C. scandens* genetic identity. *C. orbiculatus* grows rapidly and can quickly dominate areas it is introduced into. *C. orbiculatus* also twines around native trees, increasing the load on limbs and contributing to failure.

Non-chemical Treatment

Smaller plants can be hand pulled or dug out. The entire root should be removed to prevent resprouting.

Vines climbing into trees can be cut at a comfortable height to kill any of the vine in the canopy and relieve trees. The base of the vine will continue to grow, and will require continued treatment to manage. When cutting vines from trees, take care to limit damage done to the bark of the tree as much as possible, for the sake of continued tree health.

Chemical Treatment

Foliar spraying of triclopyr is recommended for large, dense patches. Foliar spray is best applied in autumn or early winter, after most other species are dormant. If the vine is fully leafed out at the time of spraying, it is recommended to use triclopyr amine over the ester form. Foliar spray should only be applied on calm days when ambient air temperature is above the required sixty-five degrees Fahrenheit.

Vines of the plant that grow up into the canopy cannot viably be treated with a foliar application. The cut stump method is preferable for *C. orbiculatus* vines that climb trees, as well as for vines that are in close proximity to desired plants. When cutting, cut the vine six inches above the ground, in case more cut stump applications are required. Immediately apply the herbicide with a brush or spray bottle. Cut stump treatment can be used at any time in the year as long as the ambient air temperature is above the necessary temperatures: forty degrees Fahrenheit for glyphosate application, and sixty-five degrees Fahrenheit for triclopyr application. The ground should not be frozen at the time of application.

Basal bark treatment with triclopyr ester can also be applied at any time in the year, if the ambient air temperature has been above the required sixty-five degrees Fahrenheit for several days. Basal bark treatment should also not be done if there is snow on the ground, or if any part of the application area is wet from rain or flooding. Before applying, cut any stems sprouting from the vine within the twelve to eighteen inch application range to reveal the bark, and apply the treatment to cover the entire of that area.

Systemic herbicides should destroy an entire *C. orbiculatus* plant in a week.

Table 8. *C. orbiculatus* Treatment Guide

Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes

Non-chemical Treatment						
Hand pulling					Mar - Nov	Small plants
Cutting					Mar - Nov	Will kill any climbing vines in canopy to relieve tree, will not destroy roots
Chemical Treatment						
Foliar spray	Triclopyr	*Garlon® 3A*, *Garlon® 4 Ultra*	Selective	2%	Oct - Nov	Use late season so most native species are dormant; ambient temperature should still be above 65 degrees F
Cut stem/stump	Glyphosate	*Rodeo®*	Non-selective	25%	Year round	Ambient air temperature above 40°F
	Triclopyr	*Garlon® 3A*, *Garlon® 4 Ultra*	Selective			Ambient air temperature above 65°F, no frozen ground
Basal bark	Triclopyr ester	*Garlon® 4 Ultra*	Selective	20%	Year round	Should only be performed when ambient air temperature has been above 65°F for several days

---

***Cynanchum louiseae* (Black Swallow-wort)**

Description

C. louiseae is a non-native rhizomatous perennial milkweed. Stems are yellowish-green, long and thin, vine-like and twining. The stems tend to climb and twist around other plant stems or themselves. Leaves are opposite, smooth, shiny, dark green, and elliptic or heart shaped with sharp tips. Flowers are small and dark purple, with five petals. *C. louiseae* has milkweed-like seed pods, with many small brown seeds attached to fluffy white hairs.

https://www.maine.gov/dacf/mnap/features/invasive_plants/cynanchum.htm

C. louiseae is spread long distances by its seeds, which float in wind, and many seeds will drop into already infested areas, increasing the density of *C. louiseae* in patches.

C. louiseae outcompetes native species and forms sprawling and dense mats of plant matter that completely cover areas, limiting the growth potential for native species. It will also twine around native species, stressing those plants and limiting ability to grow.

Non-chemical Treatment

Non-chemical treatment of C. louiseae has limited effects for control. Hand pulling or mowing the part of the plant above soil prevents the development of seed pods, limiting the ability of the plant to spread; this is not an effective method of long-term control.

Digging the roots of the plant is labor intensive, and any control established is limited as the plant will resprout from any remaining rhizomatous matter. The entire crown and root system must be removed in order to control by digging.

Any seed pods that do form should be pulled by hand and bagged or burned to prevent propagation.

Chemical Treatment

C. louiseae is a pervasive species and will require multiple years of treatment to achieve control. It is very important to not apply herbicide too early in the season when treating *C. louiseae*. While the shoots emerge in the early spring, herbicide should only be applied after the plants have begun to flower in June or July, and must be applied before

the formation of seed pods. Foliar spraying before the formation of seed pods will greatly reduce seed viability in affected plants.

Foliar spray is optimal when treating large monotypic stands of *C. louiseae*. If the exotic plants are surrounded by desired grasses, then triclopyr can be used minimize damage to grasses. Plants will appear sick one to two weeks after herbicide treatment, exhibiting yellowed leaves, and dead spots. Do not reapply herbicide to plants that are sick, as sick plants cannot effectively absorb herbicides into roots.

For particularly sensitive areas, cut stem treatment of *C. louiseae* is a viable control method. Stems should be cut to about two inches from the ground, and non-selective herbicide should be applied immediately.

Table 9. *C. louiseae* Treatment Guide

Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Hand-pulling					Aug - Nov	Target seedpods
Chemical Treatment						
Foliar spray	Glyphosate	*Rodeo®*	Non-selective	3-5%	June - July	Spray as plants begin to flower
	Triclopyr	*Garlon® 3A*, *Garlon® 4 Ultra*	Selective	1%		
	Imazapyr	*Habitat®*				
Cut stem/stump	Glyphosate	*Rodeo®*	Non-selective	50-100%	June - July	Cut stems to two inches from the ground before application

Fallopia japonica (Japanese Knotweed)

Description

https://www.hortweek.com/network-rail-loses-japanese-knotweed-court-ruling/landscape/article/1486930

F. japonica is a non-native rhizomatous perennial that is a particularly difficult exotic species to manage. The stems emerge in early spring and grow tall, up to ten feet. The stems are reddish-brown and hollow, resembling bamboo. Heart-shaped leaves are large, growing four to seven inches in length. Clusters of small, greenish-yellow to white flowers are formed in July. Fruits mature in August or September, and are winged to increase seed dispersal.

The seeds rarely germinate, and North American knotweed is presumed to be a sterile male clone. It is still possible to produce viable seeds, usually through hybridization. F. japonica mainly spreads vegetatively, extending its massive woody rhizome system and sending up new shoots. Any piece of rhizome material moved to a new area can lead to new infestation. As such, it is generally contained in defined patches, and will not cross impervious surfaces like roads easily.

F. japonica offers no ecological benefits to native species other than dense cover. It can colonize a variety of ecosystems, swiftly converting them to monocultures, and degrading habitat value.

Non-chemical Treatment

Digging is an ineffective method of management, as *F. japonica* grows from a thick rhizome, forming large crowns that are extremely difficult to fully remove.

Mowing of *F. japonica* alone is not an effective means of control, and must be coupled with chemical treatment.

Small stands of *F. japonica* can be managed by mowing the area and covering it with impervious mats, thick enough that *F. japonica* is unable to grow through. Leaving the mats in place for several years will prevent the root system from sending up new shoots in the covered area, preventing photosynthesis. If in an area of full or partial sun, the heat will also damage the root system.

F. japonica is limited in its ability to spread across impervious surfaces, and will be more easily contained closer to roads.

Chemical Treatment

The most effective method of chemical treatment is first to mow *F. japonica* at the beginning of July, and follow with herbicide application. At least six weeks should pass between mowing and herbicide application, and when herbicide is applied the height of *F. japonica* is limited to its regrowth: three to four feet tall instead of six to ten feet tall.

Glyphosate can be applied as a foliar spray. Glyphosate is a non-selective herbicide, and patches with *F. japonica* are generally monocultures. Glyphosate should be applied twice in the first year of treatment, first in early August, and following up in September before the first frost.Grass can be seeded in the area if it is necessary for erosion control. As knotweed requires multiple years of treatment, an inexpensive annual rye grass would be optimal.

F. japonica can also be treated by stem injection, where herbicide is injected at the nodes, the location where the leaves meet the stem. Stem injection directs as much chemical as possible to the root system, but is labor intensive and requires specialized injection equipment.

F. japonica thrives in a range of soils, from sandy roadsides to moist wetlands. In wetland areas, use mechanical methods to the greatest extent feasible (such as thick mats). Work from the upstream seed source to downstream populations. If chemical treatment is used, care should be taken to use an herbicide that will not injure amphibian food sources and rare species such as Blanding's turtle. The table below provides guidance on using *Rodeo®*.

Application should not exceed the regulated rate per acre, of particular concern when filling hollow stems or injecting herbicide.

Herbicide should not be applied after the first frost, as *F. japonica* is frost sensitive and will die back, leaving any herbicides applied after frost unabsorbed.

Table 10. *F. japonica* Treatment Guide

Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Mowing					Aug; Sep	
Chemical Treatment						
Foliar spray	Glyphosate	*Rodeo®*	Non-selective	2-4%[1]	Early Aug - Late Sep	Surfactant; first application: Add surfactant, must wait 6 weeks after early July mowing, second application: add surfactant, must be applied before first frost
Stem injection	Glyphosate	*Rodeo®*	Non-selective	100%	August	Injected at the stem nodes

Convolvulus arvensis (Bindweed)

Description

https://www.swcoloradowildflowers.com/White%20Enlarged%20Photo%20Pages/convolvulus%20arvensis.htm

"Deep rooted perennial vine that grows along the ground until it comes in contact with other plants or structures; then climbs aggressively. Smooth, arrowhead-shaped leaves. Slender, twining stems that can grow to 6 feet long. Trumpet-shaped flowers, light pink to white. Two small leaf bracts about one inch below the flower. Fleshy pale roots that travel deeply and widely" https://www.nwcb.wa.gov

"Reproduces vegetatively from roots, rhizomes,stem fragments and by seeds that can lie dormant in the soil for up to 20 or more years. Roots spread widely underground, both vertically and horizontally, forming dense mats. Flowering is indeterminate, so flowers continue to develop along stems until the first frost" https://www.nwcb.wa.gov

Non-chemical Treatment

"Avoid digging or tilling the soil around mature field bindweed roots; roots or rhizome fragments left behind may resprout. Repeated hand pulling works eventually, but is highly labor intensive. It is best to limit hand pulling and tilling to seedlings; do in early spring when the ground is wet. Smothering plants with mulch, black plastic or plastic-fiber mats (geotextiles) is another option, but the covering must be kept in place for several years. Success may be somewhat limited as field bindweed can persist without light, sending its underground roots beyond the edge of the covering to start a new infestation. If using coverings, check often for cracks or openings; pull or spot spray any new growth coming up through the covering. Cutting alone will not control this plant and is not recommended." https://www.nwcb.wa.gov

Chemical Treatment

"Herbicides can be painted or brushed on leaves to avoid drift onto desirable plants. Products containing glyphosate are effective when applied in the summer and fall before

the leaves die back. However, glyphosate is “non-selective” and will injure any foliage that it comes in contact with including grass. Selective broadleaf herbicides with the active ingredients triclopyr and 2,4-D work well for lawn areas as they won’t harm most grasses. Repeat on regrowth as needed. All these herbicides are absorbed by foliage and moved throughout the plant to kill the roots and shoots. If retreating with glyphosate in the same season, allow plants to grow and produce flowers before each application.” https://www.nwcb.wa.gov

Table 11. *C. arvensis* Herbicide Treatment Guide

Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Hand-pulling					Mar - Sept	
Digging					Mar - Sept	
Mowing					Mar - Sept	
Chemical Treatment						
Foliar spray	Glyphosate	*Rodeo®*	Non-selective	2%	July - Sept	
	Triclopyr	*Garlon® 3A*	Selective	3-5%		
	Imazapyr	*Habitat®*	Non-selective	2%		

Lythrum salicaria (Purple Loosestrife)

Description

L. salicaria is a non-native herbaceous perennial forb that is an aggressive invader of wetlands. Several four-sided square erect stems grow from a single plant, two to six feet in height. Leaves are opposite on the stem or in whorls around the base, and are smooth, elongated, and heart-shaped. Flower spikes are showy and magenta, made up of many small, five-petaled individual flowers, blooming late in the growing season. The fruit is a capsule developed in autumn containing small seeds.

https://www.minnesotawildflowers.info/flower/purple-loosestrife

L. salicaria is spread by seed, which are viable for many years, and remain dormant in the soil until conditions are right for growth.

L. salicaria can dominate areas where it is introduced, displacing native species and reduces biodiversity. *L. salicaria* also degrades wetlands, catching sediment that fills in wetlands, leading to reduced water flow, and decreased flood retention.

Non-chemical Treatment

L. salicaria populations can be partially managed by pulling and digging as long as the entire taproot is removed. This is time consuming and labor intensive, and should only be implemented on small pioneer populations that can be removed efficiently.

Biological control is the best method for long term large scale. Insect species can be introduced to feed on the plants, preventing *L. salicaria* from seeding and weakening, eventually destroying the plant.

Chemical Treatment

L. salicaria most commonly is found in sensitive wetland areas. The two most effective herbicides are glyphosate and triclopyr. Glyphosate and triclopyr amine, both registered for aquatic use, are commonly applied when managing *L. salicaria*. Treatment should occur prior to seed set to prevent future spread of the species.

Glyphosate can damage surrounding grasses and sedges, leaving new opportunities for colonization by *L. salicaria*. Pesticide should be selected based on density of the stands being treated, and whether or not surrounding plants are desirable. If surrounding plants are desirable grasses and sedges, triclopyr amine should be selected. If there are many exotic plants, glyphosate should be used, or a mixture of glyphosate and triclopyr. Follow up treatments will be required for years until the seedbank is depleted.

Table 12. *L. salicaria* Herbicide Treatment Guide

Application Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Hand pulling					Apr - Sep	
Digging					Apr - Sep	
Cutting					Apr - Sep	
Biological					Apr - Jun	Introduced insect species to feed on plant
Chemical Treatment						
Foliar spray	Glyphosate	*Rodeo®*	Non-selective	1-2%	Late Aug	Apply after peak bloom; cut and dispose of flower heads prior to application
	Triclopyr amine	*Garlon® 3A*	Selective	1%		
Hand wicking					Late Aug	

***Rosa multiflora* (Multiflora Rose)**

Description

R. multiflora is a thorny non-native perennial shrub. The plants is tolerant of many conditions and can grow ten feet tall and ten feet wide. Stems are long, green to brown, with hooked thorns that make hand removal hazardous. Leaves are opposite with five to eleven leaflets, and leaflets are one to two inches in length. White to pinkish five petal flowers form in clusters in the summer. The plant produces bright red fleshy fruits (hips).

https://production.wordpress.uconn.edu/cipwg/wp-content/uploads/sites/244/2014/04/RobRoutledgeSaultCollegeBugwood.jpg

R. multiflora can generate new stems to spread, but it is predominantly spread by seed.

R. multiflora is easily distinguished from native *Rosa* species. In R. multiflora the base of leaf where it is attached to the thorny stem is fringed, and the plant's white to pinkish five petalled flowers occur in branched structures.

Benefits of the plant include the food and cover it provides to native animals. However, the overall effect this shrub has on habitat value is negative. *R. multiflora* crowds out native species and creates dense, impenetrable stands. *R. multiflora* can also act almost as a vine, and choke out native trees.

Non-chemical Treatment

Controlling small populations is much easier than attempting control dense stands. Hand pulling can be effective if the entire root of the plant is removed.

Cutting or mowing alone will not control *R. multiflora*, but are useful in preparation for herbicide treatment. Cut stem application would be impossible on dense stands, so mowing leads to better control.

Chemical Treatment

Foliar applications are made in summer when *R. multiflora* is flowering, with peak bloom being in early June. Spray should thoroughly cover the foliage of the plant, wetting as many leaves as possible without dripping. Glyphosate is less effective on multiflora rose than other herbicides but may be desirable if soil activity is a concern, or to avoid damaging surrounding grasses. Triclopyr can be applied as a foliar spray, and will eliminate top growth; future applications may be necessary to destroy the root system.

Triclopyr can also be applied to cut stems or as basal bark, and is most effective when applied in the dormant season. Cut stem use when mowing or cutting is practical; remove the top growth of the shrub and wet the stubble. This method can be applied year round. Basal bark is only feasible when the base of the plant can be accessed. It is best applied from January to autumn color. Wet the lower twelve inches of plant stem without causing runoff.

Table 13. *R. multiflora* Treatment Guide

Method	Herbicide	Brand	Selectivity	Concentration	Time	Notes
Non-chemical Treatment						
Hand pulling					Mar - Nov	Remove entire root
Cutting/Mowing					Mar - Nov	Effective when followed immediately by chemical treatment
Chemical Treatment						
Foliar spray	Glyphosate	*Rodeo®*	Non-selective	2%	May - Jun	
	Triclopyr	*Garlon® 3A*, *Garlon® 4 Ultra*	Selective	1%		
Cut stump/stem	Triclopyr	*Garlon® 3A*, *Garlon® 4 Ultra*	Selective	50%	Year round	

Basal bark	Triclopyr ester	*Garlon® 4 Ultra*	Selective	20-25%	Jan - Aug	Basal oil

Important Note: *Mention of specific products in this document does not constitute endorsement. Specific product names are mentioned in the resources used to create this document. This document is meant to serve as a guideline for exotic plant management, and is not a legal authority. By law, pesticides must be applied according to their labeling.*

Subject: Lowell Heritage State Park information

Rob-

Thank you for your presentation on the Boott Hydro relicensing project on Wednesday. As a follow-up, I wanted to provide you with some additional information that may be helpful in the various studies that are planned.

The first is a 2014 Resource Management Plan for the broader complex that includes Lowell Heritage State Park. This addresses DCR ownership, recreation, and other issues within the park. The document is available here: https://www.mass.gov/service-details/lowell-great-brook-planning-unit

Secondly, our GIS team undertook a major effort a number of years ago to clarify DCR ownership of parcels within the City of Lowell. This data is currently available through Mass GIS: https://docs.digital.mass.gov/dataset/massgis-data-protected-and-recreational-openspace

Let me know if you have any questions!

Jeffrey

Working Group Participants:

Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the continued operation of the Lowell Hydroelectric Project (FERC No. 2790)(Project) located along the Merrimack River. In support of Project relicensing, Boott is conducting a Whitewater Boating and Access Study as approved in FERC's March 13, 2019 Study Plan Determination for the Project. Pursuant to the approved study plan, Boott met with the Whitewater Boating and Access Study Working Group (Working Group) at the Project on August 8, 2019. Boott provided the Whitewater Flow Documentation Plan (WFDP) to the Working Group on October 28, 2019 for review and comment.

Boott appreciates the comments on the WFDP provided by the Working Group. Please find the response to comments attached. If you have questions or need additional information, please contact Kevin Webb, Boott Hydro Licensing Manager, at (978) 935-6039 or via email at Kevin.Webb@enel.com.

Re: Response to Comments on the Lowell Hydroelectric Project (FERC No. 2790-072);
Whitewater Boating and Access Study
Whitewater Flow Documentation Plan

Dear Whitewater Boating and Access Working Group:

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc., is the Licensee and owner of the 20.16 megawatt Lowell Hydroelectric Project (FERC No. 2790) (Project). The Project is operated under a license issued by the Federal Energy Regulatory Commission (FERC or Commission) that expires on April 30, 2023. The existing license for the Project was issued by the Commission with an effective date of May 1, 1973, and the license expires on April 30, 2023. Accordingly, Boott is pursuing a new license for the Project pursuant to the Commission's Integrated Licensing Process, as described at 18 Code of Federal Regulations Part 5.

In support of Project relicensing, Boott is conducting a Whitewater Boating and Access Study (WBAS) as approved in the Commission's March 13, 2019 Study Plan Determination for the Project. In accordance with the approved study plan, Boott met with the WBAS Working Group (Working Group) at the Project on August 8, 2019 to coordinate study planning, identify potential volunteers to participate in controlled flow releases, and to identify potential put-in and take-out locations.

Consultation with the Working Group during the August 8, 2019 site visit indicated that there was a need to visually document a range of flows in the Project's bypass reach in order to assist the participants in identifying which flows to select for the controlled flow releases. Since the Working Group participants had limited experience boating the bypass reach, participants could not make informed choices on which flows would be appropriate for boating. Accordingly, Boott developed a Whitewater Flow Documentation Plan (WFDP) that describes the methods for documenting a range of flow conditions in the bypass reach, and methods for selecting study flows in consultation with the Working Group. The WFDP was submitted to the Working Group on October 28, 2019. In the WFDP, Boott proposed to document flows in the bypass reach using cellular-enabled trail cameras and Project operational data.

Boott appreciates the comments provided by American Whitewater (AW) on November 8, 2019. Based on AW's comments regarding the proposed locations of the cameras, Boott has attached a revised figure showing the updated locations for camera placement. These modified locations will capture more of the area of interest to AW, while also keeping the cameras at locations appropriate to reduce the risk of theft or vandalism. To the extent practicable, field technicians installing the cameras will adjust the locations based on field conditions with the intent of maximizing the visual documentation of whitewater features.

Boott also appreciates comments by the National Park Service (NPS) provided on November 11, 2019, and information provided regarding their operating parameters for various recreational experiences. The purpose of the WFDP is to consult with the Working Group on the methods for documenting a range of flow conditions in the bypass reach. The selection of appropriate flows for the WBAS will take place after May 15, 2020, and will occur in consultation with NPS and other members of the Working Group. Since the selection of proposed flows has not occurred, Boott believes it is premature at this time to attempt to define

the effects of WBAS flows (if any), on flows in the Merrimack River or throughout the canal system. Generally, the Working Group will likely focus on flows ranging from 500 cubic feet per second (cfs) to 2,000 cfs, which are average bypass flows the Project normally experiences. Additional consultation on the WBAS will occur in late spring of 2020.

Boott appreciates the comments by AW and NPS regarding potential impacts of the study on fishway structures and fish passage. Boott is required to operate the upstream and downstream fish bypass facilities from April 1 through July 15 and from September 1 through November 15. As a result, Boott anticipates conducting the controlled flow releases after July 15, 2020 and before September 1, 2020, therefore the controlled flow releases will not interfere with fish passage or fishway structures.

On behalf of Boott, I look forward to continued discussions and consultation with the Working Group regarding this study. Please do not hesitate to contact me at (978) 935-6039 or via email at Kevin.Webb@enel.com if you have any questions concerning this study or Project relicensing.

Sincerely,

Boott Hydropower, LLC

Subject: Lowell Hydroelectric Project (FERC No. 2790) -- Study Progress Report for Quarter 4 of 2019
Attachments: P-2790 2019 Quarterly Progress Report .pdf

Dear Stakeholders:

Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the Lowell Hydroelectric Project. Boott is currently conducting studies approved by FERC in support of Project relicensing. On January 16, 2020, Boott filed the attached Study Progress Report for Quarter 4 (Q4) of 2019 with FERC in accordance with the approved study plan. The progress report describes the activities performed through the Q4 study period, as well as relicensing study activities generally expected to be conducted within the next quarter.

Should you have any questions regarding the attached progress report, please contact Kevin Webb, Hydro Relicensing Manager with Boott, at (978) 935-6039 or kevin.webb@enel.com.

Re: Lowell Hydroelectric Project (FERC No. 2790-072)
Fourth Quarterly Study Progress Report

Dear Secretary Bose:

Boott Hydropower, LLC (Boott), a subsidiary of Enel Green Power North America, Inc. (Enel), is the Licensee and owner of the 20.2 megawatt Lowell Hydroelectric Project (Project or Lowell Project). The existing license for the Project was issued by the Federal Energy Regulatory Commission (FERC or Commission) in 1973 and expires on April 30, 2023. Accordingly, Boott is pursuing a new license from the Commission for the continued operation and maintenance of the Project. Boott has elected to utilize the Commission's Integrated Licensing Process (ILP) for the relicensing of the Lowell Project.

As proposed in Boott's January 28, 2019 Revised Study Plan (RSP) and approved in the Commission's March 13, 2019 Study Plan Determination (SPD), Boott is hereby filing the Study Progress Report for the fourth quarter of 2019 (Q4 2019). This progress report describes the activities performed through the Q4 2019 study period, as well as ILP activities generally expected to be conducted within the next quarter (Q1 2020). Unless otherwise described, all relicensing studies are being conducted in conformance with the approved RSP and the Commission's SPD.

1. Downstream American Eel Passage Assessment
    - Boott obtained silver eels for radio-tagging from a commercial vendor in Maine during early October.
    - Boott tagged and released a total of 100 adult silver eels upstream of the Project's impoundment during October.
    - Boott monitored the downstream progress of radio-tagged eels during October and November using a series of stationary receivers which were checked regularly during the passage season.
    - During Q1 2020, Boott will be analyzing downstream passage data collected during October and November on fish movement, river conditions, and station operations.

2. Juvenile Alosine Downstream Passage Assessment
    - Boott collected juvenile alosines from Turtle Pond in Concord, NH during October.
    - Boott tagged and released a total of 150 juvenile alosines upstream of the

Pawtucket Dam during October.

- Boott monitored the downstream progress of radio-tagged juvenile alosines during October and November using a series of stationary receivers which were checked regularly during the passage season.
- During Q1 2020, Boott will be analyzing downstream passage data collected during October and November on fish movement, river conditions, and station operations.

3. Upstream and Downstream Adult Alosine Passage Assessment
   - Boott is currently in the planning stages of this study.
   - Planning for this study will continue during Q1 2020.
4. Fish Passage Survival Study
   - Boott will initiate preparation of the draft fish passage survival study during Q1 2020.
   - Efforts will include compilation of all required Project and turbine parameters as well as a review of results from the American eel and juvenile alosine telemetry studies.
5. Three-Dimensional Computational Fluid Dynamics Modeling
   - Boott is currently planning and scheduling the initial 3D-Computational Fluid Dynamics (CFD) Model working group meeting for this study. This CFD Model working group will serve as a platform for discussion and refinement of the eight scenarios to be modeled among the three locations as outlined in the RSP.
   - Activities to occur during Q4 2019 include continued study planning and field data collection.
6. Instream Flow Habitat Assessment and Zone of Passage Study in the Bypassed Reach
   - Boott conducted a drone-based LiDAR survey of the bypassed reach during November.
   - Boott conducted foot-based substrate mapping and bathymetric data collected for permanently wetted sections of the bypassed reach during November.
   - Boott collected the water surface elevation and discharge measurements associated with the “low” calibration flow.
   - During Q1 2020 Boott will assemble the elevation mesh for the 2D model to identify any areas which may require additional surveying during Q2 2020.
   - Boott anticipates field data collection for the mid- and high-calibration flows will occur during Q2 2020.
7. Fish Assemblage Study
   - During Q4 2019, Boott conducted the fall sampling for the fish assemblage

study using electrofishing, gill netting, and minnow traps in the impoundment and utilizing portable electrofishing gear in the bypassed reach. This completed the sampling effort for this study.

- Boott anticipates that data analysis and report preparation will continue during Q1 2020.

8. Recreation and Aesthetics Study

- In accordance with the SPD, Boott has initiated the desktop research and literature review to identify and describe the existing recreational uses in the Project area.
- Boott consulted with the National Park Service (NPS), American Whitewater and other stakeholders to develop a list of reconnaissance and visitor intercept survey locations.
- Boott conducted field reconnaissance and visitor intercept surveys on random weekdays and weekend days through the months of May, June, July, August, September, and October. The online recreation survey is still available at the Project's relicensing website (http://www.lowellprojectrelicensing.com/).
- Boott conducted the field inventory to document existing formal and informal recreation facilities within the Project Boundary. Boott will continue to analyze this data in Q1 2020.
- Boott held a Study Workshop meeting with NPS and other stakeholders on December 18, 2019, to discuss recreation trends, utilization, facilities, and vegetation and waterborne trash in the canal system.
- Boott conducted a vegetation growth survey throughout the Project's canal system. This included a visual survey, identification of dominant vegetation types, and global positioning system (GPS) mapping of vegetative growth locations. Boott will continue to analyze this data in Q1 2020.

9. Historically Significant Waterpower Equipment Study

- In accordance with the SPD, Boott is conducting background research and consulting with the NPS and other parties to develop a list of historically significant waterpower equipment at the Project.
- Boott held a Study Workshop with the NPS and other stakeholders to collect information regarding this study in Q4 2019.
- During Q1 2020, Boott intends to work closely with an architectural historian to review significant historical equipment owned and operated by Boott within the Project Boundary.

10. Resources, Ownership, Boundaries, and Land Rights Study

- Boott has initiated an internal search for rights-of-way, land lease agreements, surveys, easements, and maintenance agreements related to the Lowell Project.
- Boott has obtained and initiated a review of the three main documents that establish the framework of this study: The Great Deed, the Order of Taking of

the Commonwealth of Massachusetts, and the lease from the Commonwealth of Massachusetts to the Lowell National Historical Park.

- On December 18, 2019, Boott held a consultation meeting with stakeholders, including the NPS and the City of Lowell, to collect information regarding this study.
- During Q1 2020, Boott anticipates a continued review of documents regarding property rights, roles, and responsibilities in coordination with the NPS, Massachusetts Department of Conservation and Recreation (MADCR), the City of Lowell, and private land owners (as applicable).

11. Water Level and Flow Effects on Historic Resources Study

- Boott consulted with the NPS to determine the locations of pressure transducers (level loggers) to monitor flow levels in the canal system.
- Boott deployed water level loggers in June 2019. This is a minor variance in the study plan which called for deployment and data collection to begin on May 1, 2019. Boott plans on collecting continuous data for one full calendar year from the initial date of data collection.
- Monthly water level downloads occurred during Q4 2019. Data download is expected to continue through Q1 2020.
- On December 18, 2019, Boott held a consultation meeting with stakeholders, including the NPS and the City of Lowell, to collect information regarding this study in Q1 2020. During this meeting, stakeholders clarified that their interest is related to the effects of the new crest gate system and potential effects on historic resources at higher water levels. Boott explained that any effects would be limited to structures along the Northern Canal and the Upper Pawtucket Canal. Stakeholders agreed that the historic resources along the Northern Canal and Upper Pawtucket Canal should be the focus of this study. Stakeholders and Boott agreed that Boott should move level loggers to those locations (Upper Pawtucket Canal and Northern Canal), and remove the remaining level loggers from the downtown canal system.

12. Whitewater Boating and Access Study

- Boott initiated consultation with the stakeholders to establish a Whitewater Boating and Access Study Working Group (Working Group). The Working Group conducted a site visit at the Project in August 2019 (Q3 2019) and identified action items necessary to facilitate the study, including flow documentation and a plan for accessing the bypass reach.
- During Q4 2019, Boott developed a Whitewater Flow Documentation Plan (WWFD Plan) and submitted it to stakeholders for review and comment. The WWFD Plan documents the methodologies proposed by Boott to capture the bypass reach under various flow conditions to determine the optimal flows to include during the controlled flow releases in the summer of 2020.
- Boott anticipates continued consultation with the Working Group through Q1 2020, with the intent of conducting controlled flow releases in Q3 2020 when flow

conditions and operational restraints permit.

13. Operation Analysis of the Lowell Canal Study

- Boott is continuing to review and prepare documentation on Project operations, including the operation of the Project's canal system.
- In Q1 2020, Boott anticipates continued review of Project operations and initial development of a study report documenting the findings of the operation analysis.

Please do not hesitate to contact me at (978) 935-6039 or kevin.webb@enel.com if you have any questions concerning this matter.

Sincerely,

Boott Hydropower, LLC

Subject: Re: Lowell Hydroelectric Project (FERC No. 2790) -- Study Progress Report for Quarter 4 of 2019

Thanks for this report. I regret that I was unable to represent the NH LMRLAC at the December Stakeholders Meetings. I trust that the City of Nashua, a major abutter of the Impoundment, is a Stakeholder and was represented.

Questions for Kevin Webb:

1.The Crestgate installation has important but unknown implications for the Impoundment shoreline in New Hampshire below Cromwells Falls. To what extent do the depth logging and analysis activities include the area at or above the NH-MA border?

2. To what extent did your outreach to recreational users include the NH Paddlers (**www.nhamcpaddlers.org) or other NH recreational communities?**

Thanks
Gene Porter
Chair NH LMRLAC

> Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the Lowell Hydroelectric Project. Boott is currently conducting studies approved by FERC in support of Project relicensing. On January 16, 2020, Boott filed the attached Study Progress Report for Quarter 4 (Q4) of 2019 with FERC in accordance with the approved study plan. The progress report describes the activities performed through the Q4 study period, as well as relicensing study activities generally expected to be conducted within the next quarter.

Subject: Lowell Initial Study Report Meeting - March 11, 2020

Hi Christine –

Boott Hydropower is filing the Lowell Hydroelectric Project Initial Study Report (ISR) on February 25, 2020 and planning a subsequent ISR meeting with NPS and partners on March 11, 2020. The conference room in the LNHP Visitor Center worked out well for our last meeting. The ISR meeting will be long with a similar sized group.

If possible, we would like to hold the upcoming March 11 ISR meeting in the LNHP Visitor Center conference room again. Can you let us know if this will work for your team? Let us know if you have any questions.

Thank You -

Subject: Lowell Initial Study Report Meeting - March 11, 2020

Hi Christine –

Boott Hydropower is filing the Lowell Hydroelectric Project Initial Study Report (ISR) on February 25, 2020 and planning a subsequent ISR meeting with NPS and partners on March 11, 2020. The conference room in the LNHP Visitor Center worked out well for our last meeting. The ISR meeting will be long with a similar sized group.

If possible, we would like to hold the upcoming March 11 ISR meeting in the LNHP Visitor Center conference room again. Can you let us know if this will work for your team? Let us know if you have any questions.

Thank You -

Hi Christine –

To follow up on this as well, these types of meetings can last all day but usually do not. Does it work with your team to hold the meeting in the conference room on March 11?

Hi Christine:

As for timing of the meeting, FERC requires us to hold the ISR meeting within 15 days of filing the ISR report, so the 11th is our last day to hold the meeting. I know that the 10th wouldn't work for us, the 9th is a maybe at best. The previous week we are meeting with the fish agencies, prior to getting together with FERC for the ISR meeting. BTW, we expect that Amy Chang, the new FERC project leader and possibly other FERC staff will plan to attend.

Regarding attendance by CRP, I expect that Jason will attend. Hopefully I can get Matt Stanley, our General Manager, and Curt Mooney, our Regulatory Affairs Manager, to attend at least part of the day. Agree 100% that face-to-face time is very important.

Have a great weekend!

Kevin

Kevin, I had been exchanging emails with Jason Bush about his plans to visit Lowell the week of March 10. Will he or any other new points of contact from Central Rivers Power be attending the stakeholder meeting? NPS is very interested in meeting face-to-face with new folks we will be working with.

Kelsey, would the stakeholder meeting be the whole day, a couple of hours? Does the meeting have to happen on Tuesday or could we look at Wednesday or Thursday?

Christine: We are looking to schedule our waterborne trash survey and mapping, and I wanted to check in with you to see if there were any specific dates that we should target or avoid. We'd like to get the fieldwork completed before mid-April, and we'd like to meet briefly with NPS staff that may have relevant information on waterborne trash issues while we're at the project.
We can be pretty flexible in terms of scheduling the fieldwork, but just let us know what makes sense on your end.

Re: Lowell Hydroelectric Project (FERC No. 2790)
ILP Process Plan and Schedule

Dear Stakeholders,

Boott Hydropower, LLC (Boott) is the Licensee, owner, and operator of the 20 megawatt Lowell Hydroelectric Project (Project) (FERC No. 2790). Boott operates the Project under a license from the Federal Energy Regulatory Commission (FERC or Commission). The Project's existing license expires on April 30, 2023. Boott is pursuing a new license for the Project using the Commission's Integrated Licensing Process (ILP) as defined in 18 C.F.R. Part 5.

Pursuant to the ILP, Boott filed the Initial Study Report (ISR) with the Commission on February 25, 2020, and conducted the ISR Meeting on March 11, 2020. As noted during the ISR Meeting, the ILP Process Plan and Schedule presented in the ISR was inaccurate. The correct Process Plan and Schedule can be found in FERC's September 27, 2018 Scoping Document 2 (SD2). A copy of the Process Plan and Schedule presented in SD2 is attached for your reference. Upcoming milestones related to the ISR are presented in Table 1, below.

Table 1. Upcoming ILP Pre-filing Milestones Related to the ISR.

Responsible Party	Pre-filing Milestone	Date	FERC Regulations
Boott	Initial Study Report	2/25/2020	5.15(c)(1)
All stakeholders	Initial Study Report Meeting	3/11/2020	5.15(c)(2)
Boott	Initial Study Report Meeting Summary	3/26/2020	5.15(c)(3)
All stakeholders	Any Disputes/Requests to Amend Study Plan Due	4/25/2020	5.15(c)(4)
All stakeholders	Responses to Disputes/Amendment Requests Due	5/25/2020	5.15(c)(5)
FERC	Director's Determination on Disputes/Amendments	6/24/2020	5.15(c)(6)

Please also note that the contact information for Boott's Licensing Manager is:

Mr. Kevin Webb
Licensing Manager
Boott Hydropower, LLC
607 N. Commercial Street, Suite 204
Manchester, NH 03102

Should you have any additional questions, please do not hesitate to contact me at (978) 935-6039 or kwebb@centralriverspower.com.

Sincerely,
Boott Hydropower, LLC

Kevin M. Webb
Licensing Manager

APPENDIX A
LOWELL HYDROELECTRIC PROJECT PROCESS PLAN AND SCHEDULE

Shaded milestones are unnecessary if there are no study disputes. If the due date falls on a weekend or holiday, the due date is the following business day. Early filings or issuances will not result in changes to these deadlines. As appropriate, the process plan and schedule may be revised in the future.

Responsible Party	Pre-Filing Milestone	Date	FERC Regulation
Boott Hydropower, LLC	File NOI/PAD with FERC	4/30/18	5.5, 5.6
FERC	Tribal Consultation	5/30/18	5.7
FERC	Issue Notice of Commencement of Proceeding; Issue Scoping Document 1	6/15/18	5.8

Dear Stakeholders –

Boott Hydropower, LLC held the Initial Study Report (ISR) Meeting on March 11, 2020. Thank you to all those attended or called in.

As noted during the ISR Meeting, the Integrated Licensing Process (ILP) Process Plan and Schedule presented in the ISR was inaccurate. The correct Process Plan and Schedule can be found in FERC's September 27, 2018 Scoping Document 2 (SD2), which is posted on the Lowell Relicensing website here: http://www.lowellprojectrelicensing.com/

Please see attached for additional information on the upcoming ILP Pre-filing milestones. Should you have any questions, please contact Kevin Webb at kwebb@centralriverspower.com.

Thanks, Kelsey.

I have one correction - on page 12:

> *River Merrimack asked if there were plans to look at water quality, especially given combined sewer overflow (CSO) events in Manchester, NH.*

This was not River Merrimack - it was the Merrimack River Watershed Council.

Thanks,

Peter

Hi Jean,

We are working with Boott Hydropower, LLC to conduct studies for relicensing of the Lowell Hydroelectric Project (FERC No. 2790). During the Study Workshop with stakeholders on December 18, 2019, you kindly offered to provide additional information and GIS shapefiles regarding UMass Lowell facilities throughout the Lowell Downtown and Canal System. Are you able to provide these at this time?

I've attached the Study Workshop meeting minutes as a reminder of the discussions. Thank you for any updates and information you can provide.

Best regards,

Kelsey Scott, MS

	Robert Quiggle – HDR	Patrick Donahue – Boott Hydropower
	Stephen Greene – Lowell Canal Cleaners	Kelsey Scott - HDR

Boott Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC) for the continued operation of the Lowell Hydroelectric Project (FERC No. 2790) (Project) located along the Merrimack River. In support of Project relicensing, Boott is conducting a Recreation and Aesthetics Study; Water Level and Flow Effects on Historic Resources Study; Historically Significant Waterpower Equipment Study; and the Resources, Ownership, Boundaries, and Land Rights Study (Resources Study). Boott requested a Lowell Hydroelectric Project Study Workshop (Workshop) with interested stakeholders to address data needs regarding the four studies of interest. Boott appreciates the participation of stakeholders and the thoughtful discussions during the Workshop. At the request of Workshop participants, Boott has developed this general summary of Workshop topics and discussion.

Introduction

- The Workshop began with a general overview of the Project, the FERC relicensing process, and a discussion of the study schedule. A copy of the PowerPoint presentation is included as Attachment A to this meeting summary.

Resources Study

- Stakeholders and Boott agreed that identifying resource ownership, boundaries, and land rights is a foundational study task that will inform a number of other studies, and eventually any management measures included Boott's license application documents.
- Stakeholders recommended that the Resources Study evaluate which parties have the authority to address issues, and which have the obligation to do so, based on a review of easements, deeds, and land rights documentation. Stakeholders and Boott agreed that the end result of the Resources Study should be a document that clearly identifies who has responsibilities and obligations with respect to the canal system, so that when future issues related to maintenance, repair, or public safety arise, the party or parties responsible for resolving these issues can respond quickly and effectively.
- These rights and responsibilities need to be detailed in a GIS database as well as a written report.
  - The responsibility of maintaining the GIS database and documentation will be evaluated through future conversations.
- To inform the Resources Study, Boott is proposing to review the Great Deed, Letter of Taking, and the lease from the Commonwealth of Massachusetts to the NPS.
  - Stakeholders indicated that the City of Lowell (City) may also have relevant property records.
  - The City also previously undertook limited research into ownership and responsibilities for the walkways adjacent to the Canal. Boott requested any records from the City that may be helpful in determining ownership and responsibilities for Project features.
  - The NPS indicated that they had developed a preliminary matrix of ownership and responsibilities based on a limited review of documents. Boott requested the existing matrix from the NPS, recognizing that the matrix is preliminary and would require additional review/documentation.
- The University of Massachusetts at Lowell (UMass Lowell) indicated concerns regarding infrastructure in the canal system, including submerged cables and pipelines. UMass Lowell has infrastructure in the canal system, and agreed to share relevant records with Boott.
- Boott suggested that a Resources Study Working Group may be appropriate to coordinate a review of relevant documents. Boott expects that a review of the existing documentation would take place in quarter one of 2020.

Recreation

- On-water recreation and access is the primary public request received by National Park Service (NPS) and Massachusetts Department of Conservation and Recreation (MADCR). Stakeholders are not necessarily interested in a study which looks at every aspect of recreation; rather, parties are looking for specific practical opportunities for community on-water recreation which provide paths of least resistance. Stakeholders want to know the recreational opportunities they can maximize, and which opportunities are not feasible or are too risky

based on public safety, public interest, and hydropower operational constraints. Boott's primary concern is public safety issues associated with providing recreational access to the Project's canal system.

- Stakeholders noted that parties looking for specific recreational opportunities can focus on expanding current recreational opportunities, such as expanding boat tours on the Pawtucket Canal, and providing more access for the Annual Point of Life Festival on the Western Canal. The parties can also look at specific future opportunities of interest, like providing safe seasonal access at Swamp Locks or kayaking in the Western Canal for organized events.
- Boott indicated that the results of visitor–intercept surveys and the online recreation survey could provide information regarding public interest in on-water recreation.
- Boott expects to assess the potential for safe recreational access to the canal system as a component of the Recreation and Aesthetics study and looks forward to continued conversations with stakeholders regarding this issue.

Vegetation Growth along the Canal System

- Vegetation growth along the canal system is a significant issue for the NPS and other stakeholders. Vegetation growth is not only an aesthetic issue, but has the potential to cause structural damage to the canal system walls and other structures. The NPS requested that Boott consider vegetation growth not just from an aesthetic standpoint but also as it relates to potential structural damages. Boott recognizes this concern and believes that the ongoing vegetation mapping along the canal system will inform both the aesthetics concerns and the potential structural integrity of the canal system.
- The NPS currently undertakes vegetation management along the canal system, but funding for these programs is limited and competitive. The current procedures implemented by the NPS are not intended to be long-term solutions, but rather to keep the problems at bay. Under the NPS's current vegetation management program, it takes approximately five years for the NPS to treat/manage the vegetation along the entire canal system.
- The NPS does not have the capability to address the removal of larger trees that may cause damage to canal structures.
- The NPS also treats exotic/invasive plan species along the canal system. The NPS agreed to share the Exotic Species Treatment Calendar with Boott.
- Stakeholders recognize that it may be appropriate to identify priority areas for vegetation management (e.g., areas where vegetation along the canal system has the highest potential to adversely affect structures), with the goal of addressing these areas first. Vegetation treatment measures should eventually be undertaken for the entirety of the canal system, with the goal of implementing routine management measures to stop new vegetation growth.
- The NPS's current management of vegetation along the canal system is limited in part because the ownership of and responsibility for canal structures is not clear. Understanding the ownership and responsibility for maintenance of the canal structures is an important component in determining how any vegetation management issues can be implemented.

Trash in the Canal System

- Waterborne trash accumulation in the canals is the main complaint reported to the City. The waterborne trash floats down the Merrimack River and builds up behind the gatehouses, or is thrown/blown into the downtown canals.
- Trash at the bottom of canals is a concern to stakeholders due to the hazardous nature (e.g., electronics) but also the aesthetics when the canals are drawn down. Both Boott and stakeholders acknowledged that there are significant safety and liability concerns with managing trash at the bottom of the canals.
- All parties acknowledged the liability concerns of collecting and disposing of any hazardous materials.
- The current methods of flushing the trash out are not meeting the visual and structural safety goals of stakeholders.
- The Studies conducted as part of the relicensing should examine the feasibility of different options for removing waterborne trash from the canals, and also how the other stakeholders can participate. Boott is interested in targeting the source of the trash problem. Examples of the contributions of stakeholders include community education regarding trash and placement of trash bins in strategic areas. A trash management plan for the canal system could incorporate how all stakeholders can contribute to best manage the problem. Boott and stakeholders acknowledged that trash management is not the sole responsibility of the licensee, but would require input and assistance from the City, NPS, and other stakeholders.

Historically Significant Waterpower Equipment

- The NPS would like to determine what equipment owned/operated by Boott is historically significant on a national level. This study does not need to go down the path of documenting every single component, but rather determining what equipment owned/operated by Boott is nationally significant, original, and within the Project boundary. This will tie into the Resources Study, since the ownership and responsibilities of the equipment will need to be determined.
- Boott noted that FERC is very likely to require the development of a Historic Properties Management Plan (HPMP) as a result of the relicensing process. The HPMP would describe how Boott would manage historic waterpower equipment within the Project boundary during the term of the new license; and the HPMP could incorporate provisions for consultation with the NPS regarding historic waterpower equipment. For example, the HPMP could establish provisions such as the right of refusal by NPS when historic waterpower equipment is being replaced or decommissioned. FERC would require the HPMP to be developed in consultation with the NPS and the State Historic Preservation Officer pursuant to a Programmatic Agreement.
- Boott noted that this study had been initiated, and that Boott's cultural resources management consultant, Gray & Pape, Inc., was in the process of reviewing historical documentation. Boott expects that a field visit will occur in quarter one of 2020.

Water Level and Flow Effects on Historic Resources

- Boott has been collecting water level data in the canal system since the spring of 2019. During the Workshop, the NPS clarified that their interest is related to the effects of the new crest gate system and potential effects on historic resources at higher water levels. Boott explained that any effects would be limited to structures along the Northern Canal and the Upper Pawtucket Canal (upstream from the Francis Gate and Guard Locks), as the water levels in the remainder of the canal system are not affected by the crest gate. Given the lack of higher water levels elsewhere through the canal, stakeholders agreed that the historic resources along the Northern Canal and Upper Pawtucket Canal should be the focus of this study. Therefore, stakeholders and Boott agreed that Boott should move level loggers to those locations (Upper Pawtucket Canal and Northern Canal), and remove the remaining level loggers from the downtown canal system.
- The NPS noted that certain recreation activities are prohibited based on water levels and flows. Recreational activities on the Northern Canal and the Upper Pawtucket Canal can be impacted by higher flows (the boat tours and canal walkway).
- There is interest in knowing what impacts (if any) low water levels (i.e., drawdowns) can have on historic resources and canal infrastructure. If possible, stakeholders would like to develop recommendations regarding maintenance drawdowns (e.g., timing and duration) to limit impacts to historic structures.

Other Considerations

- The City and other stakeholders are concerned about potential impacts to water quality in the canal system as a result of stormwater discharges and combined sewage overflows (CSO). Boott noted that the Massachusetts Department of Environmental Protection (MADEP) will issue a Water Quality Certificate (WQC) for the Project under Section 401 of the Clean Water Act. Stakeholders did not request a water quality study during the FERC study scoping process, and FERC did not require Boott to conduct a water quality study. Since any impacts to water quality that may occur as a result of stormwater discharges and CSOs are not Project-related and there is no nexus to Project operations, it is unlikely that FERC would require Boott to study this issue during relicensing.
- The City has an MS4 Permit executed through the wastewater team. This permit may provide information regarding discharges into the canal system. It is unknown what these outfalls are for, who they belong to, and what the discharge is (weep holes, etc.). Documenting outfalls would be an extensive undertaking and would not necessarily absolve stormwater concerns.

Thank you again for your participation in the Workshop. Should you have any additional comments on or clarifications to this meeting summary, please notify Kevin Webb of Boott Hydropower at kwebb@centralriverspower.com.

Kelsey,

Thanks for giving me a call. To summarize, NPS units are directed to follow state and local guidance for COVID. To stay consistent with MA guidelines, the Gray & Pape site visit should be limited to a gathering of <10 people, face coverings should be worn by all, social distancing should be practiced wherever possible, and folks should take separate vehicles between sites.

cc'd: Laurel Racine, Cultural Resources Chief and David Lieb, Historical Architect should attend and Peter Lonsway, Deputy Superintendent would like to attend. To make the most of the field visit, could you please share draft documents from Gray & Pape's research in advance of the visit?

July 9th is the NPS preferred field visit date; July 16th alternate. Please let us know if you'd like more date options. Thanks!

Hi Christine and Celeste,

We would like to re-engage with you regarding the ongoing studies as part of the Lowell Relicensing. As per your request at the Initial Study Report meeting, we can schedule with you the onsite visit with the architectural historian (Gray & Pape) for the Historically Significant Waterpower Equipment Study. Regarding this field visit, as well as the other ongoing studies, a conference call with this group would be helpful to understand how LNHP is currently approaching operations, hours, safety measures, etc during COVID-19.

Feel free to propose times that work for you in the coming weeks, and we'll set up a conference call. Thank you -

Hi Christine –

We've let Gray & Pape know the preferred dates for the site visit and I hope to have an update for you in the coming days. Currently, the COVID-19 safety requirements for HDR, Gary & Pape, and LNHP are similar enough that it is not expected to be an issue (in terms of planning the site visit).

Thank you –

Scott, Kelsey

To: Scott, Kelsey
Subject: FW: Boott Hydro Equipment Background

Rob & Kelsey,

As per your request, I've conducted background research to determine the extent of the available documentation on the Lowell Hydroelectric Project (FERC No. 2790). Documentation of the hydroelectric components of the larger Lowell Canal System is scant.

The 2018 Pre-Application Document (PAD) for the Lowell Hydroelectric Project notes the Project's major civil works, which include:

- The 1,093-foot-long, stone-masonry gravity Pawtucket Dam (1847 & 1875), topped by a 5-foot high pneumatic crest gate system;
- The 5.5-mile Pawtucket & Downtown canal system that provides flow to four small hydroelectric stations (Hamilton, Assets, Bridge Street, & John Street) located in historic mill buildings;
- The Pawtucket Canal with its Guard Lock & Gates Facility that controls flow into the canal system;
- The main powerhouse containing two 8.6 MW horizontal Kaplan turbine-generator units;
- A fish-lift system at the powerhouse, and;
- A fish ladder adjacent to the Pawtucket Dam

Many of these civil works date from the nineteenth century and are associated with the use of the Merrimack River waterpower as a mechanical power source for the city's textile mills. The use of the river's waterpower to generate electricity came slowly. Patrick Malone's *Waterpower in Lowell: Engineering and Industry in Nineteenth Century America* (2009) notes that while all Lowell's mill complexes had either installed new hydroelectric units or linked generators to some of their existing turbines by 1918, the Lawrence Manufacturing Company continued to rely solely upon mechanical drive as late as 1927 (p. 223). The Historic American Engineering Record (HAER) documentation of the Lowell Canal System (1983) describes the civil and mechanical works in considerable detail, but closes its narrative in the 1880s, prior to the introduction of hydroelectric power. Similarly, other major sources on the history of Lowell, including Laurence Gross' *The Course of Industrial Decline: The Boott Cotton Mills of Lowell, Massachusetts, 1835-1955* (2000) and Theodore Steinberg's *Nature Incorporated: Industrialization and the Waters of New England* (2004) do not provide any detail on the hydroelectric facilities at Lowell.

It seems clear that historians' interest in Lowell and its waterpower system is largely limited to the period of mechanical power transmission between about 1825 and 1880. The introduction of hydroelectric facilities in the Lowell mills has yet to be explored.

Hello –

Please find attached further information regarding the records review conducted for the Historically Significant Waterpower Equipment Study.

Currently, the headcount for the site visit on July 16th is eight. Participants are Patrick O'Bannon (Gray & Pape), Laurel Racine, Peter Lonsway, David Lieb, Robert Quiggle (HDR), and Kevin, Richard, and Andrew from Boott Hydropower.

Any questions or comments, let us know. Thank You –

Please count in from NPS, Laurel Racine, Cultural Resources Chief and David Lieb, Historical Architect. If there is space for one additional body keeping the group under 10, Lowell NHP Deputy Superintendent, Peter Lonsway is interested in attending.

Are there any documents from the consultant NPS can review in advance of July 16 to make the most of this field visit?

Agenda

Project:	Lowell Hydroelectric Project (FERC No. 2790)
Subject:	Historically Significant Waterpower Equipment Study
Date:	Thursday, July 16, 2020
Location:	Lowell, MA

Boot Hydropower, LLC (Boott) is pursuing a new license from the Federal Energy Regulatory Commission (FERC or Commission) for the Lowell Hydroelectric Project (FERC No. 2790) (Project) located along the Merrimack River. In support of Project relicensing, Boott is conducting a Historically Significant Waterpower Equipment Study. In consultation with the National Park Service (NPS) Boott clarified the goals of this study during the December 18, 2019 Study Workshop held at the Lowell National Historical Park Visitor Center. Boott understands that NPS's goals for this study are to determine what original hydroelectric equipment owned/operated by Boott within the Project boundary is historically significant on a national level.

As a component of this study, Boott is conducting a site visit of certain Project facilities on July 16, 2020. The purpose of this site visit is to conduct an initial assessment of the historic significance of Project hydroelectric equipment and collect additional documentation. Boott notes that many of the Project's civil and mechanical components have been well documented in the Historic American Engineering Record (HAER), but those facilities pre-date the introduction of hydroelectric power at Lowell. As a result, the significance of hydroelectric components have not been assessed. Boott's July 16, 2020 site visit will focus on identifying historic hydroelectric equipment, and will include the following facilities:

- Pawtucket Gatehouse
- Hamilton Power Station
- John Street Power Station
- Assets Power Station

Site visit participants are invited to meet at the NPS Visitor Center parking lot at 9:00 a.m. on July 16, 2020 (GPS address 304 Dutton Street, Lowell, MA 01852).

If you require additional information, please contact Kevin Webb with Central Rivers Power at 978-935-6039 or Kwebb@centralriverspower.com or Rob Quiggle with HDR at 724-989-1579 or Robert.Quiggle@hdrinc.com.

All:

Following up on our on-site meeting on the 16th, attached is a copy of Mel Lezberg's "Magic Book" of facts and figures – at least I think that's what he called it. I do not know where the original is. My guess is that it is early 1950's vintage as the latest date recorded in the tables is 1949. Note that all elevations are PL&C datum which is 5.2 feet higher than "mean sea level" or NGVD29 datum. Interesting table on page 4 compares the numerous datum planes in MA.

To my best understanding, the downtown turbines that are (or were) part of the Lowell Project are:

- Hamilton (page 29; Textron American, Inc.) – All 5 units listed are authorized under the FERC license. Associated generators are listed on page 30.
- John St. (page 31; Boott Mills – Amory St.) Unit #'s 3, 4, 5, and 6 are authorized under the license. Unit 1 was originally included in the license but was removed in the early 1980's. Associated generators are listed on page 32.
- Section 8 (page 33, Boott Mills – "Massachusetts Yard") – these are Units 4, 5 and 6 denoted "Section 8" in the left margin.
- The 4 "Massachusetts Mills" units that we recently removed from the license are also listed on page 33, as "Main Power" Units 1-3 plus Unit 12.
- Assets (page 36 – Boott Mills "Bigelow Yard") - Units 1-3 are currently in the FERC license but will be removed via relicensing as they are no longer functional. Associated generators are on page 37.

Let me know if you have any questions.

Hello –

An agenda is attached to provide more logistical information regarding the upcoming site visit this week for the Historically Significant Waterpower Equipment Study. Please plan to meet at the Visitor's Center parking lot (304 Dutton Street) at 9am on Thursday, July 16. Thank you.

Would a call tomorrow afternoon at 1 or 2 PM work? I am in meetings all day on Thursday and Friday, but I'd like to touch base this week before Kevin goes on vacation.

If that schedule works for folks, I will send a WebEx invite.

Thanks,

Robert Quiggle, RPA

Hi Rob,

We should schedule a call to set a date and discuss logistics for the whitewater boating study. Also, I would like to get the images of the different flow levels that you all collected so we can identify a flow range for the study. Thanks.

Thanks, Kevin! I for one am pretty excited to have access to "a magic book of canal facts." Our notes on next steps from the Historical Water Power Eqauipment Study site meeting are:

1. Central Rivers Power / HDR / Gray & Pape to have an internal call about the study scope and following would reach out to NPS to confirm scope.
2. NPS to provide HSRs and other archives from the park's PLC collection by request.

Attached are 6 documents for you to look through and develop your request for additional information as needed per the agreed upon study scope. Please let me know if there are questions or anything that I can clarify. Happy researching- we look forward to touching base on the scope when you're ready.

1. **Finding Aid Part I for Proprietor's of Locks and Canals** - LOWE-ARCHIV-FindingAid-0908-PL-CI
   This is searchable and has more current (1980s). Look for whatever terms you think are relevant and make a list of Boxes/Folders you would like to see.
2. **Finding Aid Part II for Proprietor's of Locks and Canals** - LOWE-ARCHIV-FindingAid-0908-PL-CII
   This is primarily not searchable, but it does explain how the collection was broken up. It may help you find out who has drawings that don't belong to the park. Since this isn't searchable the next two documents have transcriptions of the relevant sections of the finding aid.
3. **PL&C Finding Aid Transcript_Draft**
   This is a transcription of most of the photos in the collection. A list of photo numbers and titles that you want to see is fine for this.
4. **PL&C Drawings Inventory**
   This is a spreadsheet of most of the drawings in the park's PL&C collection. A list of Plan Nos. and Titles that you want to see works for the drawings. As a general rule if there are no dimensions listed we do not have the drawing. It may be at Center For Lowell History. Their findings can be searched online at https://libguides.uml.edu/archives
5. **LHPC-FindingAid-2012-UPDATED**

   This is the finding aid for the Lowell Historic Preservation Commission Records. As with the PL&C info you can make a list of Boxes/Folders you would like to see.

6. **Lowell National Historical Park Planning Document Library**
   This is our list of digitized HSRs and related studies available upon request.

PREFACE

This document, *Finding Aid for Proprietors of the Locks & Canals on Merrimack River Records, 1747-2008 (bulk dates 1844-1970)*, describes records created and maintained by the Proprietors of the Locks & Canals corporation which built the canals and established the waterpower in Lowell, Massachusetts. This finding aid, comprising Volume I, represents the culmination of a multi-stage cataloging project carried out in three phases between 1999 and 2008 by staff at the Northeast Museum Services Center (NMSC). Backlog catalog money funded the three phases. Volume II contains guides to the photographs and drawings written by former Lowell National Historical Park (LOWE) Collection Manager Dan Walsh.

Throughout the process, the NMSC catalogers expressed their gratitude towards the staff of the Lowell National Historical Park for their assistance in carrying out this work, in particular, Mr. Walsh who cared for, described, and gave access to this collection for many years. In the FY08 phase, thanks go to Museum Specialist Jack Herlihy and David Blackburn, Chief of Cultural Resources and Programs.

COPYRIGHT AND PRIVACY RESTRICTIONS

The copyright law of the United States (Title 17, *United States Code*) governs the making of photocopies or other reproductions of copyrighted materials. The Privacy Act of 1974 (5 *United States Code* 552a) governs the use of materials that document private individuals, groups and corporations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a reproduction if the document does not infringe the privacy rights of an individual, group or corporation. These specified conditions of authorized use include:

- non-commercial and non-profit study, scholarship, research or teaching
- criticism or commentary
- as a NPS preservation or security copy for research use
- as a research copy for deposit in another institution

If the researcher later uses a copy or reproduction for purposes in excess of "fair use," the researcher is personally liable for copyright, privacy, or publicity infringement and agrees to indemnify the NPS from any legal action as a result of the error. Permission to obtain a photographic, xerographic, digital or other copy of a document **does not** indicate permission to publish, exhibit, perform, reproduce, sell, distribute or prepare derivative works from the document without permission from the copyright holder and from any private individual, group or corporation shown or otherwise recorded.

Permission to publish, exhibit, perform, reproduce, prepare derivative works from, sell or otherwise distribute the item must be obtained separately in writing from the holder of the original copyright (or if the creator is dead from his/her heirs) as well as from any individual(s), groups or corporations whose name, image, recorded words or private information (e.g. employment information) may be reproduced in the source material. The holder of the original copyright **is not** necessarily the National Park Service. The National Park Service is not legally liable for copyright, privacy or publicity infringement when materials are wrongfully used after being provided to researchers for "fair use."

This institution reserves the right to refuse to accept a copying order if fulfillment of the order is judged in violation of copyright or federal or state privacy or publicity law. This institution also places restrictions on the use of cameras, photocopiers and scanners in the research room.

INTRODUCTION

This finding aid describes the Proprietors of the Locks & Canals (PL&C) Records, 1747-2008 (bulk dates 1844-1970), which consist of correspondence, legal documents, photographs, charts, graphs, maps, tables, reports, newspaper clippings and other technical and administrative materials related to the extended business dealings of the PL&C.

From the time of their active use by PL&C to their physical relocation to the Park's collections area, the records remained with the corporation at their offices, variously in the Boott Mill Counting House (attached to Boott Mill #6), Boott Mill #8, and 9 Central Street. Portions of the collection were physically transferred to Lowell National Historical Park in the 1980s and 1990s. In the summer of 1999, the Directors' Records and General Files were brought to the Charlestown, Massachusetts headquarters of NMSC for processing. The records processed during the 1999 project include the Directors' Records and the General Files, the files maintained by the corporation's administration for the purposes of reference and record-keeping. These two types of records comprise the initial two series of the collection (Series I. Directors' Records and Series II. General Files). Anthony Reed and Jalien Hollister, working for the Society for the Preservation of New England Antiquities (SPNEA, now Historic New England) under a cooperative agreement with the National Park Service, processed these series, and Mr. Reed wrote their description. The records were rehoused in acid-free containers; photocopies of the original containers were made onto acid-free paper and placed at the front of the new folders to preserve any data on them.

In 2002 and early 2003, Museum Specialist Teri DeYoung and Lead Museum Technician Patricia ("Tricia") Miller cataloged the deeds, tax records, flowage records, and stock records of the Proprietors' records. Student interns Anika Skogstrom, Dacia Metes, and Mary McCann, along with Ms. Miller, processed these series under the direction of Ms. DeYoung, Senior Archivist Liz Banks, and former NPS/SPNEA Archivist Jennifer Lyons. This FY02 and FY03 phase encompassed five series based on administrative function: Physical Data of Canal Operation (Series III.), Deeds (Series IV.), Flowage Records (Series V.), Tax Records (Series VI.) and Stock Records (Series VII). Ms. DeYoung wrote the finding aid for this phase.

In FY08, the remainder of Proprietors of the Locks and Canals records in the park's collection storage facilities was transferred to NMSC for cataloging. Between the second and third phases, two surveys conducted by NMSC staff identified these additional materials.[1] Minute books from the recent past were donated to the park and complete the series of Directors' Records. [2] NMSC Archivist Margaret Welch organized and catalogued these remaining series including legal records and files belonging to the engineers' office and compiled this finding aid incorporating the first two finding aids. A small amount of material belonging to previously catalogued series makes up the Addendum.

[1] Ms. Banks and Ms. DeYoung conducted a February 2003 survey of unprocessed Proprietors materials. Regional Archivist David Vecchioli found additional materials in his 2005 survey for a Collection Management Plan. Ms. Banks and former SPNEA technician Jennifer Quinn made the initial survey of Proprietors materials in July 1999.
[2] Part of accession LOWE-769.

The park's staff is responsible for the item-level descriptions of the Photographs and Architectural and Engineering Drawings series. Between 2000 and 2002 park staff, led by Dan Walsh, cataloged the photographs from the collection. In total, 4,030 catalog records representing more than 6000 images have been entered into the park's ANCS+ database. For several years, park staff also described the over 11,000 individual plans and drawing. Dan Walsh served as project coordinator with Rebecca Hartwell and Michelle Verfaillie from LOWE park staff, along with volunteers Clee A. Ace, Kathy Dery, and Steven Sussman. Volume II of this finding aid contains Mr. Walsh's guides to the photographs and drawings.

The PL&C records collection contains a significant amount of oversize material (larger than the 8½" x 14" folders), often folded within the original files. All oversize material was removed to more appropriately-sized containers. Separation sheets were left in the original location as well as with the oversize item in its new location. Both separation sheets describe the item and indicate both original location and subsequent relocation.

The finding aid is divided into five sections:

- Part 1: Collection Description:
  - Scope and content note
  - Outline showing the organization of the collection;
  - Descriptions of the series into which the collection is organized.
- Part 2: Corporate History.
- Part 3: Collection Listing:
  - Document boxes: a box and folder list;
  - Oversize material .
- Bibliography.
- Appendices:
  - A: Alphabetical index of General Files (photocopied from File 10xx).
  - B: List of files known to be missing.
  - C: Maps of Lowell, 1828 and 1975

PART 1:

COLLECTION DESCRIPTION

SCOPE AND CONTENT NOTE

Proprietors of the Locks & Canals Records, 1747-2008 (bulk dates 1844-1970)

Accession number: LOWE-111, LOWE-132, and LOWE-769.

Catalog number: LOWE 5058.[3]

Quantity: 229.5 linear feet (approximately 367,200 items); approximately 11,000 items (Architectural and Engineering Drawings series); approximately 6,000 items (Photographs series).

Storage: 202 legal archives boxes, 4 half-size legal archives boxes, 39 print boxes, 30 flat boxes, 23 index boxes, 41 map folders and 4 rolled storage boxes.[4]

Location: Lowell National Historical Park, 67 Kirk Street, Lowell, Massachusetts 01852-1029, (978) 970-5241.

Description: The Proprietors of the Locks & Canals Records, 1744-2008 (bulk dates 1844-1970), consist of administrative records, correspondence, charts, graphs, deeds, photographs, technical notebooks, reports, maps, legal documents and newspaper clippings. The corporation, chartered in 1792, began as an affiliation of businessmen interested in using the Merrimack River to promote commerce to Newburyport. Into the later 19th and earlier 20th century, PL&C existed primarily for the administration and maintenance of Lowell's complex series of canals and locks, all the while developing a strong local economy based on the town's numerous textile mills that ran on the abundant hydropower and maintaining a firm control of both land and water rights. After the establishment of Lowell National Historical Park in 1978, PL&C sold rights for usage of the canals and walkways.

Cross-references: There are several other collections which closely relate to these records:

- Harvard University's Baker Library maintains numerous record groups relating to PL&C and affiliated companies (Boott Cotton Mills, Hamilton Manufacturing Company, Tremont and Suffolk Mills, among others).

[3] Additional numbers LOWE 6391 (Architectural and Engineering Drawings), and individual numbers for photographs in that series.
[4] See Volume II for storage of photographs and architectural and engineering drawing series.

- University of Massachusetts-Lowell maintains a significant collection of PL&C plans and drawings, as well as a collection of the company's technical photographs.

- The LOWE museum collection holds related items:

  - *Boott Mills Records (LOWE 15733). The two companies shared an interlocking directorate in the late 20th century and the records in this era frequently refer to PL&C.*
  - *Individual PL&C artifacts.*

Organization: *Proprietors of the Locks & Canals Records, 1747-2008 (bulk dates 1844-1970)*

Series Descriptions

The Proprietors of the Locks & Canals Records, 1747-2008 (bulk dates 1844-1970), are arranged into series based on their function within the corporation.

Series I. Directors' Records, 1813 - 1988

The first series is a collection of minutes of the meetings held by the corporation. The initial 4 volumes in this series ("Directors' Records" 1813 – 1877; gap 1826-1842) are original manuscript bound volumes. The following 7 volumes ("Locks & Canals Directors' Records" 1792 – 1941) are also bound volumes, although these are typed transcriptions of minutes from the meetings of the Directors and, starting in 1921, the Executive Committee of PL&C. Finally, there is one volume of minutes from the annual and special meetings of the corporation, 1876 – 1940. A recent accession added minutes up to and including 1988.

Series II. General Files, 1836 - 1962

The second series is a collection of primarily subject files maintained by the corporation's administration. These files were used by the corporation for reference and record-keeping. Within these files, subject strengths include the administrative organization of the corporation, design and research of various aspects of hydropower technology, waterway and meteorological data for the New England region, commercial and industrial history of Lowell and the broader textile industries, and, to a lesser degree, the professional careers of some of PL&C's more significant characters.

Approximately one-third of the General Files were held in the corporation's library as sewn-spine bound volumes, separate from the post-bound volumes and office folders that housed the materials more routinely used by the corporation's administrative offices. This original numerical order has been preserved, although the bound volumes have been reunited with the post-bound volumes and foldered records.

The General Files are organized by a numerical order created and maintained by the PL&C, based on, primarily, a four-digit number and title (file "1027 Engineering Instruments, 1895-1947", for example) expanded variously by decimals (file "1006.1 Nashua Yard, 1947-1955"), letters (file "1004-D Newmarket Mfg. Co., 1933-1954") and combinations thereof (file "1012.04B Merrymeeting Lake Dam Construction, 1921-1924").

While the numbering convention employed by the corporation is of logical construction, it does not always functionally perform as such. Subjects are often grouped near one another, but -

given the complex administrative workings of the corporation's holdings - there are occasional overlaps and breaches. Particular attention should be paid to placement and order of file number elements as well as punctuation. File "1004-A1 Columbia Textile Company Fire Protection, 1920-1928 …" is different from file "1004.1A Bigelow-Hartford Carpet Co. New Fire Pump, 1918-1919".

Also reflective of the complex nature of the numbering system is the occasional duplication of file numbers (duplications not noted in the corporation's indexes), necessitating the addition of bracketed numbers by park staff. Often these duplicate numbers are closely related in subject, sometimes identical save for date ranges and the added number in brackets.

Additionally, some of the file numbers listed in the corporation's indexes are known to be absent, either files created and no longer existing, or file numbers created as "space holders" but never utilized. (See Appendix B for a list of missing files.) Conversely, some items exist in the collection that are nowhere in the indexes. These instances are rare and, when encountered in processing, a folder title was created based on the file's contents and bracketed to indicate an artificial title created in processing.

Items of particular interest to researchers include: information regarding the Lowell Industrial Development Company in boxes 17 through 20; individual letters from Uriah Boyden to Kirk Boott (1836), to James B. Francis and to P. T. Jackson (both 1840) in box 34, folder 1; information about land acquired or owned by PL&C in box 52, folders 5 and 6; materials on the history of water wheels and engineers in box 52, folders 8 and 9; draft and illustrations for The American Mixed Flow Turbine and Its Setting (1922) in box 53, folders 2 through 4; materials on PL&C dealings with the City of Lowell, boxes 64-66; information regarding the contents and disposition of materials in the PL&C library, in box 66, folder 6; information on floods affecting PL&C, boxes 68 and 69; a 1921 inventory of materials belonging to the PL&C, including mill equipment and office supplies, in box 90, folder 2. Moreover, a group of files dealing - largely but not exclusively - with financial matters (taxes, boxes 77-79; insurance, box 80; reports to the treasurer of PL&C, boxes 81-83; tax list statements to assessors, boxes 83-85; real estate, boxes 85-88) is notable for its relatively large mass.

Lastly, some materials deserve specific listing for their infrequent and isolated placement throughout the collection. Appendix A., an alphabetical index to the General Files. It may prove useful to researchers for this series of PL&C materials, and for other related portions of this collection as well.

Series III. Physical Data of Canal Operations, 1837 - 1967[5]

Series III will be of particular interest to researchers as it contains primary documentation created by James B. Francis while at the PL&C. As Agent from 1845 to 1889 Francis developed and oversaw construction improvements that revolutionized hydropower in the United States and

[5] These dates include those of items in the Addendum.

propelled Lowell to the first manufacturing center in the country.[6]

The third series is a collection of notebooks that contain physical data of canal construction, hydropower development and general canal operation. This series includes logbooks, day books, waste books, experiments and daily field notes. Importantly, this series represents the work and master reference material of engineer James B. Francis. In particular, Sub-series A contains the data, designs and experiments generated by Francis. Sub-series B deals with general operation information and includes precipitation measurements, memoranda and information about the weirs and canals. Sub-series C is a compilation of data from tests and field surveys produced by PL&C employees under the guidance of Francis.

The notebooks are organized by type chronologically therein numerically or alphabetically. In some cases the labels seem random, as with Sub-sub-series 1. General Books. The notebooks start at "8" then go to "9", "10" and "10a" then skip to "16". After "16" the notebooks are labeled Vol. "A" then Vol. "F" through "I" and then "O", "Q" and "T". Although there appear to be missing volumes, the notebooks are somewhat chronological with few interruptions. The order created by the PL&C was maintained as near as possible throughout.

The Addendum contains related twentieth-century records including a few water measurement logs from the 1960s.

Series IV. Deeds, 1747 - 1952

The fourth series documents the PL&C's acquisition of rights for access, ownership and construction along the Merrimack and Concord Rivers from the mid-eighteenth century through the mid-twentieth century. The Deeds were originally tri-folded and housed in envelopes organized numerically from 1 to 7001. Two large blocks of numbers, 1415 to 5001, and, 5814 to 7001, had not been located by the park and were not found during processing. Each envelope contained information relating to a particular transaction such as a deed, lease agreement, survey, plans, maps or receipts. Although there appears to be no apparent chronological or alphabetical order to the overall series, it is possible that the records are arranged geographically. An alphabetical index accompanied the records.

Series V. Flowage Records, 1834 - 1903

The fifth series is a collection of documents concerning indemnification for property damaged by flooding along canals and waterways owned or maintained by the PL&C. The collection was organized in envelopes numerically from 8001 to 8452. An alphabetical index accompanied the records.

---

[6] Hands, Divers. *Illustrated History of Lowell and Vicinity Massachusetts.* Lowell, Mass., Courier-Citizen Company, 1897, 164.

Series VI. Tax Records, 1828 - 1986

The sixth series is a collection of documents that provide a general accounting of taxes paid by the PL&C from 1900-1919. The records consist of plot surveys or schedules, assessments, petitions and published notices. Sub-series A. Street Resolutions is arranged alphabetically. Sub-series B. Taxes 1900-is arranged chronologically. These series is continued in the Addendum with various federal and state tax records.

Series VII. Stock Records, 1854 - 1954

The seventh series is a collection of stock certificates, receipts and associated documentation relating to shares owned by stock holders in the PL&C. Currently there are two bound volumes in this series.

Series VIII. Financial Records, 1890 - 1985

This series is composed of incomplete runs of records. For example, the financial statements in sub-series A. required to be filed by the Commonwealth of Massachusetts cover only 1981-1985 (one dates from 1955). Sub-series B. holds several indexes to accounts such as those for canal water usage. The bank account records are from the 1920s. Sub-series C. contains insurance policies from the 1950s.

Series IX. Legal Records, 1822 - 1921

This series is composed of the published charters, indentures and agreements related to PL&C and the mills with which it engaged.

Series X. Engineers' Files, ca. 1870 - 1956

The files in the first sub-series, created by Chief Engineer Hiram Mills (1836-1921) and organized presumably by his office staff, relate to a range of subjects including the mill companies and land negotiations. The largest file describes the legal case of Judge Charles Cowley vs. the Proprietors in which Cowley accused PL&C of Merrimack River contamination, which caused him to become gravely ill. The files were ordered in numbered envelopes. Sub-series B., Reference Materials, contains the hydropower machinery illustrations and catalogs compiled for engineering purposes. These materials were found in labeled magazine boxes. Chief Engineer Arthur Safford received most of the drawings from non-PL&C projects for which he acted as consultant; the PL&C staff kept the material for reference.

Series XI. Subject Files, 1948 - 1987

These files are apparently the successors to the General Files in Series II. Unlike those files, they are not numbered but are identified only by a label title. They contain newspaper clippings on the creation of the Lowell Heritage State Park and Lowell National Historical Park. Possibly

the President's Office kept these records for the entire company's reference as several folders hold copies of correspondence to the president.

Series XII. Labor Records, 1956

The very small amount of index cards documents the pay scale of retired and disabled works in 1956. Only park staff may view the cards because access is restricted due to the presence of personal information. Park staff may disclose most of the information.

Series XIII. Reservoir Records1920, 1950 - 1953

The PL&C maintained a reservoir across the Merrimack which provided water for fire suppression to its clients. Two record books document the height and amount of water pumped.

Series XIV. Physical Plant Records, 1896 - 1921

The PL&C was responsible for providing water and electricity to its clients. Index cards describing the various meters are the only records present in this series.

Series XV. Real Estate Records, 1900 - 1948

The PL&C held many tracts of land in downtown Lowell. These indexes give names of the tenants to whom PL&C leased property. They refer to "rent books" which are not present in this collection.

Series XVI. Affiliated Companies Records, 1962 - 2008

By 1964, outside interests led by George Horvath of New York City had burdened PL&C with debt. A group of Lowell investors took back control of the company (along with the Boott Mills) and ran companies closely affiliated with PL&C to, in large part, manage the debt. Corporation Investments, Inc. (CII) was formed by this "Lowell Group" of investors, and it eventually held PL&C, Stone Investments, Inc. (SII), Boott Mills, Wisconsin Investments, Inc. (WII), and Ocwen, Inc. as wholly-owned subsidiaries. A plan of refinancing the debt was entered into by CII and its subsidiaries in 1964 with a committee authorized to control all the assets of the companies. Records indicating these complex financial arrangements including a 1975 refinancing agreement with the Teamsters' group are in this series.

Because these companies were so closely related, they filed their taxes in concert and kept copies of financial records in the PL&C/ Boott Mills record offices. Sub-series A. "Joint Records" has some of these records. The minutes of directors' and stockholders' meetings and articles of organization comprise the sub-series related to CII, WII, SII, and Ocwen. This series also holds the documentation of the major debt refinancing plans.

The Lowell Land Company was formed to sell off real estate formerly held by PL&C. Its officers were managers of the mills, and PL&C engineer Arthur T. Safford served also as its engineer. The company voluntarily dissolved 19 December 1945.

Little is known about Lowell Industries. It is assumed it had a close relationship to PL&C because its minutes were included in PL&C records.

Series XVII. Miscellaneous Materials, 1945-1957

These items were located in PL&C records but do not belong to a currently defined series.

Series XVIII. Photographs

Volume II describes the majority of photographs created for and managed by PL&C. The researcher should note that some individual photographs were integrated originally in document files. They remain in the files, now in archival housing, and their presence is recorded in footnotes.

Series XIX. Architectural and Engineering Drawings

See Volume II for description.

Series XX. Oversize Materials

These items are grouped together because of their common size. All are intellectually associated with the letter- and legal-size materials but are too large to be stored in standard legal-size folders and boxes.

PART 2:

CORPORATE HISTORY

HISTORY OF THE PROPRIETORS OF THE LOCKS & CANALS

The Proprietors of the Locks & Canals on Merrimack River (PL&C) was chartered in 1792 by a group of merchants and ship owners from Newburyport, Massachusetts. They intended to boost commerce at Newburyport by improving the navigability of the Merrimack River through construction of the Pawtucket Canal around the rapids at East Chelmsford. Although they succeeded, completion of the Middlesex Canal in 1803 linked the Merrimack watershed directly to Boston and diverted the majority of the trade away from Newburyport. The Pawtucket Canal languished until December 1821, when PL&C was bought out and reorganized by the Boston investors who capitalized the Merrimack Manufacturing Company earlier that year. Their objective was to turn the under-used transportation canal into the main feeder of a waterpower delivery system for a large industrial complex. In 1825, PL&C's charter was amended to allow it to own real estate, water rights, and mill privileges. In 1826, the Merrimack Manufacturing Company transferred back to PL&C its ownership of the Pawtucket Canal and the land and water rights it had held since 1821, as well as its machine shop. Consequently, due to its unprecedented control of land and water, PL&C became a primary instrument of the economic and social development of Lowell, as the community was renamed in 1826.

In 1826, PL&C began actively selling land and waterpower privileges, in units called "mill powers", to the newly chartered textile companies. The Merrimack and Hamilton Manufacturing Companies were first, in May 1826, followed by the Appleton, Middlesex, Suffolk, Tremont, Lawrence, Lowell, Boott, Massachusetts, and Prescott companies, and the Lowell Machine Shop, between 1828 and 1845. In 1845, PL&C's machine shop and foundry were separately incorporated as the Lowell Machine Shop and PL&C began selling surplus land to individual small holders. Its role as a waterpower company first and foremost became clear as its secondary functions were pared away. Under the direction of its Chief Engineer James B. Francis, PL&C completed the canal system in 1848, thus capturing the full 11,000 constant horsepower potential of the Merrimack River. By the 1870s this system powered eleven textile corporations, which employed close to 15,000 people and produced over 3.6 million yards of cloth per week. As the first such waterpower company of its kind in the nation, PL&C became the model for other large suppliers, notably the Amoskeag Company of Manchester, New Hampshire, and the Essex Company of Lawrence, Massachusetts.

PL&C continued to improve individual canals and maintain its water rights well into the twentieth century. As a result, its managers and engineers participated in the growing development of hydroelectric power generation in Lowell and eastern Massachusetts. As the major textile corporations began leaving Lowell during the 1920s, local investors, including Boott Mills, formed the Lowell Industrial Development Company and the Assets Realization Company to purchase and manage the water rights and properties of those companies as they liquidated or left. These two successors to the textile companies worked with PL&C to manage the waterpower resources, which included seventeen working turbines, four of which were seriously damaged in the flood of 1936 and taken off line.

The PL&C utilized its water resources in other ways. It provided water from its reservoir to the

fire suppression systems in the remaining mill structures until 1994, and, through its ownership of the Pawtucket Canal, continues to sell industrial process water (as opposed to waterpower) to various customers.

In the early 1960s PL&C underwent a change of ownership when a group of Lowell investors took back the corporation from New York City based interests led by George and Ernest Horvath. The Horvaths, after taking over Massachusetts Mohair Plush Company and Boott Mills, had acquired PL&C in 1959 and quickly borrowed large sums from the Trustees of the Central States, Southeast and Southwest Pension Fund (belonging to the Teamsters' Union), the Archdiocese of Boston, and Lowell's Union National Bank. The Lowell investors, deeply concerned about the Lowell institutions' financial viability, bought the Boott Mills, PL&C, and other Horvath holdings.[7]

This "Lowell Group," having assumed these large debts, created new companies Wisconsin Investments, Inc., Stone Investments, Inc., and Ocwen, Inc., to ease the financial burden of PL&C, the Boott Mills, and the Union National Bank. Corporations Investments, Inc., owned PL&C , the Boott Mills, and these companies as subsidiaries, and an interlocking directorate, led by Eldred L. Field, the McKittrick family, and others, managed the companies and were the primary stockholders. Selling stock in the new companies raised capital, and the companies filed joint tax returns to share tax writeoffs in the 1960s through the 1980s.

The Boott Mills and PL&C became so intertwined in the 1970s that joint directors meetings were held. For the last quarter of the twentieth century, Marshall Field and Mel Lezburg led the firms. Both firms greatly benefited when the state and federal government bought their real estate and the rights to use the canals and waterways for the new state heritage and national parks.

The most visible legacy today of PL&C waterpower, apart from the canal system, is Boott Hydropower. Boott Mills and PL&C arranged for construction of the Eldred L. Field Powerhouse facility on the Merrimack River at its junction with the Northern Canal in the early 1980s. In 1986, Boott Hydropower became a wholly owned subsidiary of Consolidated Hydropower, and now Enel (North America) runs Boott Hydropower. In addition to the Field Powerhouse, thirteen working turbines located in the old textile mill structures remain able to provide additional power generation as demand requires and available water allows.

[7] Mehmet Ali explains this complex financial situation in his dissertation "To Save a City: From Urban Renewal to Historic Preservation in Lowell, Massachusetts, 1920 -1978," University of Connecticut, 2006, pp.279 -286.

PART 3:

COLLECTION LISTING

PHASE 1 (FY99) PROJECT

Series I. Directors' Records

Box 1 (5.0" legal size)
Folder:

1. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound manuscript volume], 1813-1825[8]
2. Directors' Records, #2 [Minutes from the meetings of the Directors of the PL&C; bound manuscript volume], 1843-1853[9]
3. Directors' Records, #3 [Minutes from the meetings of the Directors of the PL&C; bound manuscript volume], 1853-1877[10]
4. Directors' and Executive Committee Records [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; bound manuscript volume], Vol. 7, 1921-1939. (Part 1 of 2)[11]
5. Directors' and Executive Committee Records [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; materials removed from sleeve], Vol. 7, 1921-1939. (Part 2 of 2) †
6. Records of the Directors - Proprietors of the Locks & Canals on Merrimack River [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; signed, typed copies of record], 1940-1955. (Part 1 of 2)
7. Records of the Directors - Proprietors of the Locks & Canals on Merrimack River [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; signed, typed copies of record], 1940-1955. (Part 2 of 2)
8. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound typed transcripts], Vol. 1, 1792-1812

Box 2 (5.0" legal size)
Folder:

1. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound typed transcripts], Vol. 2, 1813-1842
2. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound typed transcripts], Vol. 3, 1843-1853
3. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound typed transcripts], Vol. 4, 1853-1877
4. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound typed transcripts], Vol. 5, 1877-1889

[8] Bound volume removed to oversize box 1; typed transcripts available in box 2, folder 1.
[9] Bound volume removed to oversize box 2; typed transcripts available in box 2, folder 2.
[10] Bound volume removed to oversize box 2; typed transcripts available in box 2, folder 3.
[11] PL&C's Executive Committee began meeting in 1921.

5. Directors' Records [Minutes from the meetings of the Directors of the PL&C; bound typed transcripts], Vol. 6, 1889-1904

Box 3 (5.0" legal size)
Folder:

1. Directors' Records [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; bound typed transcripts], Vol. 7, 1904-1921[12]
2. Directors' Records [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; bound typed transcripts], Vol. 8, 1921-1931
3. Directors' Records [Minutes from the meetings of the Directors and the Executive Committee of the PL&C; bound typed transcripts], Vol. 9, 1931-1941
4. Directors' Records [Minutes from the annual and special meetings of the PL&C; bound manuscript volume], 1876-1940[13]

Box 3a (5.0" legal size)[14]
Folder:

1. Directors' Records [Minutes from the meetings of the Directors; signed, typed copies of record], January 1956-January 1960 (Part 1 of 2)
2. Directors' Records [Minutes from the meetings of the Directors; signed, typed copies of record], January 1956-January 1960 (Part 2 of 2)
3. Cover to above
4. Directors' Records [Minutes from the meetings of the Directors; signed, typed copies of record], February 1960-June 1964 (Part 1 of 2)
5. Directors' Records [Minutes from the meetings of the Directors; signed, typed copies of record], February 1960-June 1964 (Part 2 of 2)
6. Cover to above

Box 3b (5.0" legal size)[15]
Folder:

1. Directors' Records [Minutes from the meetings of the Directors], 1965-1988[16] [photocopy]
2. Stockholder Meetings Minutes, 1941-January 1960 (Part 1 of 2)
3. Stockholder Meetings Minutes, 1941-January 1960 (Part 2 of 2)
4. Cover to above
5. Stockholder Meetings Minutes, 1964-1981 (with Minutes from the meetings of the Directors, 1964-1965) [photocopy]

[12] PL&C's Executive Committee began meeting in 1921.
[13] Bound volume removed to oversize box 3.
[14] All items from accession LOWE-769.
[15] All items from accession LOWE-769.
[16] Includes sets of minutes from special joint meetings of PL&C, Boott Mills, and Boott Hydropower beginning in 1980.

1. "Conservation and Water Power Development" by Arthur T. Safford, 1926.

PHASE 2 (FY02-FY03) PROJECT

Series III. Physical Data of Canal Operations

A. Master Reference Material of James B. Francis
1. General Books

Box 1 (5.0” Legal size)
Folder:

[21] This item was removed from Volume II of The New England Flood of 1927, and is an abstract of Safford's 1945 report. See "Merrimack River Flood Control Report. Arthur T. Safford, 1945" in Box 67, Folder 7 and Box 68, Folders 1 and 2.

1. Records, 1882 (no. 8)
2. Records 1884-1895 (no. 9) †
3. Records, 1892-1900 (no. 10)
4. Records, 1884-1891 (Vol. 10a) †

Box 2 (5.0" Legal size)
Folder:
1. Records, 1901-1947 (no. 16) †
2. Records, 1837-1865 (Vol. A) †
3. Records, 1855-1863 (Vol. F)
4. Flume Measurements, 1855 (Vol. G)

Box 3 (5.0" Legal size)
Folder:
1. Records, 1866-1879 (Vol. H) †
2. Records, 1866-1875 (Vol. I)
3. Records, 1876-1882 (Vol. O) †
4. Records, 1877-1882 (Vol. Q) †
5. Records and Newspaper Clippings, 1879-1915 (Vol. T) †

Box 4 (5.0" Legal size)
Folder:
1. Bridges, 1883
2. Equations, Drawings & Surveys, 1836-1844
3. Land, 1881-1882
4. Prescott Mill Foundations, 1843-1845 †
5. Records, 1882-1909 †

Box 5 (5.0" Legal size)
Folder:

1.Stock Account, 1885-1893
2.Stock Account, 1894-1898

2. Logbooks

Box 5 (5.0" Legal size)
Folder:
3. Level Notes, Pertaining to Water Measurements, Comparison at the Stop Watch with the Chronometer, 1868-1869
4. Levels, Measurements and Memoranda, 1867-1870
5. Measurements, Memoranda, Pertaining to Water Measurements
6. Memoranda, 1871-1873

7. Memoranda, 1874-1875
8. Memoranda, Surveys, Levels, Pawtucket Dam, 1872-1875
9. Memoranda, Surveys, Levels, 1875
10. Miscellaneous, Levels, Notes, and Memoranda, 1868-1871
11. Miscellaneous Notes, 1870-1871
12. Notebook, 1866-1867
13. Notebook, 1867
14. Notes, Levels, Tremont Raceway, 1868-1869

3. Daybooks

Box 6 (5.0" Legal size)
Folder:
1. Daybook, 1853-1864
2. Daybook, 1866-1876, no. 12 †
3. Daybook, 1871-1876 †
4. Daybook, 1876-1881 †
5. Daybook, 1881-1892 †
6. Daybook, 1882-1883 †

4. Waste books
***a)*. James B. Francis**

Box 6 (5.0" Legal size)
Folder:
7. James B. Francis- Waste Book, 1841-1845
8. James B. Francis- Waste Book, 1845-1846, Turbines, Weir Experiments- Northern Canal (No.1)
9. James B. Francis – Waste Book, Jan-Oct, 1846, Gradation of Dynamometer, Turbines, Northern Canal (No. 2)
10. James B. Francis – Waste Book, Oct- Nov, 1846, Guard Gates, Northern Canal. (No. 3)
11. James B. Francis- Waste Book, 1847, Turbine experiments, Calculation of Maximum Coefficient of effect of Appleton Company's 3 large turbines (No. 6)

Box 7 (5.0" Legal size)
Folder:
1. James B. Francis- Waste Book, 1846-1847 (no. 4)
2. James B. Francis- Waste Book, 1847-1848 (no. 5)
3. James B. Francis- Waste Book, 1847-1854 (No. 6) †
4. James B. Francis- Waste Book, 1849-1850 (no. 7) †
5. James B. Francis- Waste Book, Apr – Sept. 1850 (No. 8)
6. James B. Francis- Waste Book, 1851-1854 (No.9) †

Box 8 (5.0" Legal size)

Folder:
1. James B. Francis- Waste Book, 1854-1861 (no. 10) †
2. James B. Francis- Waste Book, 1861-1866 (no. 11) †
3. James B. Francis- Waste Book, 1866-1871 (no. 12)

***b.*) Hiram Mills**

Box 8 (5.0" Legal size)
Folder:
4. Hiram Mills- Waste Book, 1862-1863

5. Experiments
***a).* Hydraulic/ Weir**

5. Calculations on abnormal experiments in comparison of flume and weir measurements, Dec. 1863 †
6. Experiments, Weir, Jul- Aug, 1843
7. Experiments, Weir, Aug. 1843-1844

Box 9 (5.0" Legal size)
Folder:
1. Exp[eriments] & Trans[lation] [from French Hydrology] 1845-1851
2. Hydraulic Experiments, 1851-1856 (no. D 10)

***b.)* Dynamometer**

3. Experiments- Dynamometer, Apr-May, 1850
4. Experiments- Dynamometer, May 1850
5. Experiments- Dynamometer, May-Nov, 1850 †
6. Dynamometer Exp[eriments] 1853-1855 [Book 11)
7. Measurements of Power with Dynamometer 1870-1893

6. Water measurements/ Discharge

Box 10 (5.0" Legal size)
Folder:
1. Discharge Tables, Victor Wheels, Tremont Mils [N.D.]
2. Heights of water at Pawtucket Dam and Lake Winnipisseogee Rainfall, 1891-1893
3. Heights of water in Winnipisseogee Lake, 1883-1902
4. Heights, Winnipisseogee Lake, 1894
5. Levels, Aug. 11, 1859
6. Levels etc. Pertaining to Water Measurements, 1866
7. Memo – Levels & Meas'ts at City Reservoir in July 1873

8. Memo- Meas't of flashboards & Flashboard irons at Pawtucket Dam, Jan 1876, Levels [?] at Middlesex Dam
9. Record of Locks & Canals Reservoir, July 1920-Feb.1931†
10. Notes on the Calculation and Excavation of Embankments, 1834
11. Table √ 2gh [N.D]
12. Table of √ 2gh

Box 11 (5.0" Legal size)
Folder:
1. Tables, Miscellaneous √ 2gh √ h/h1†
2. Tables- Water Flowing over Weirs [N.D]
3. Tables- Water Flowing over Weirs [N.D.]
4. Tables- Water Flowing over Weirs [N.D.]
5. Tables- Water Flowing over Weirs [N.D.] †
6. Tables- Water Flowing over Weirs [N.D.] †
7. Waste book, 1848-1850 (no. 7)
8. Water Measurements, Jun- Jul 1852 (no. 1)
9. Water Measurements, Jul- Aug 1852 (no. 2)

Box 12 (5.0" Legal size)
Folder:
Water Measurements, Aug- Oct 1852 (no. 3)
Water Measurements, Oct-Nov 1852 (no. 4) †
Water Measurements, July 1852
Water Measurements, Aug-Sep 1852
Water Measurements, Aug-Nov 1852
Water Measurements, Oct-Nov 1852

7. Surveys

Box 13 (5.0" Legal size)
Folder:
1. Coordinate Surveys-F. Gilman's Calculation Book, 1866-1891
2. James B. Francis, Sept. 28, 1844 (D.B.?) [Oct 1, 1884-Dec 19, 1884]
3. Land Surveys, 1841-1844 (Vol. S)
4. Land Surveys, 1869-1884 (Vol. S, formerly Vol. R)
5. Lawrence New Mills, Dec. 1853-Jan 5, 1860
6. Memoranda relating to the rebuilding of the Tremont Mills, 1862

8. Mills

Box 14 (5.0" Legal size)
Folder:
1. Mills – Floor Plans and property surveys †

2. Schedule and Description of the Mills and other Buildings in the Yard of the Boott Cotton Mills, 1873 (2 copies)
3. Tremont Mills Enlargement, Apr. 26 – Jun 19, 1862

9. Turbines

***a).* Design**

Box 14 (5.0" Legal size)
Folder:
4. Massachusetts Turbines – Design Mar. 1856-Jul 1857
5. Turbines- Merrimack MFG Co.- Design †

***b).* Tables**

Box 14 (5.0" Legal size)
Folder:
6. Tables- Appleton Co. †
7. Tables-Boott Cotton Mills †
8. Tables-Hamilton MFG Co. †
9. Tables- Lawrence MFG. Co †
10. Tables- Lowell Machine Shop †
11. Tables-Lowell & Middlesex Turbines
12. Tables – Mass Cotton Mills †
13. Tables-Merrimack MFG. Co †
14. Tables-T&S Mills †
15. Miscellaneous tests etc, 1891-95 (no. 11) †

***c).* Tests**

(1) General Tests

Box 14 (5.0" Legal size)
Folder:
16. Turbines Tests, etc, 1846-68 †
17. Turbines Tests, etc, 1868-77 (vol. L) †
18. Turbine Tests – J. Emerson, 1869-71

(2) James B. Francis Field Tests

19. Houston Turbine – Test of Turbine Water-wheel

Box 15 (5.0" Legal size)
Folder:
1. Kidleberger Turbine-Worcester Mass.- Test of Turbine Water-Wheels
2. Luther Scroll Wheel – Test of Turbine Water-Wheels
3. Reynolds & Breast Wheels- Test of Turbine Water Wheel
4. Stetson Turbine- Uvbridge- Test of Turbine Water Wheels
5. Trullinger Turbine- Test of Turbine Waterwheels
6. Upham Turbine- Test of Turbine Water Wheel
7. Wheeler Turbine- Berlin Mass. – Test of Turbine Water Wheels
8. Whitney Turbine- Leominster, Mass- Test of Turbine Water Wheels
9. Wynkoop Turbine- Test of Turbine Water Wheels
10. Experiments on Merrimack Turbine No. 4 in Sept 1850

10. Franklin Forbes

Box 16 (5.0" Legal size)
Folder:
Franklin Forbes- Vol. 1, October 15, 1845-Marhc 30, 1846 †
Franklin Forbes- Vol. 2. April 18, 1846 – January 6, 1847
Franklin Forbes- Vol. 3 January 7, 1847-March 20, 1848
Franklin Forbes- Vol. 4, March 22, 1848-April 12, 1849
Franklin Forbes-Vol. 5 [James B. Francis completed volume after Forbes's Death]

B. General Operations Logbooks

1. Rainfall/Temperature Readings

Box 17 (5.0" Legal size)
Folder:
1. Rainfall and Temperature at Pawtucket Dam-1895-1919, Temperature at Old Guard Locks 1889-1919

2. Record of Rainfall kept by Props. Locks & Canals at Guard Gates of Northern Canal- 1855-1944, Record of Temperature kept by PL& C at Pawtucket Dam- 1848-1944-Lowell, Mass
3. Record of Rainfall kept by Props. Locks & Canals at Guard Gates of Northern Canal Lowell, Mass. 1945-1958
4. Record of Rainfall Kept by Props. Locks & Canals at Guard Gates of Northern Canal, 1855-1938, Record of Temperatures kept by P.L& C at Pawtucket Dam, 1848-1937, Record of Temperatures kept by P.L. & C at Old Guard Locks, 1889-1937 †
5. Water Measurements, Tabulations, Diagrams and General Info †

2. Tables/ Weirs/ Canals[22]

Box 17 (5.0" Legal size)
6. The book of Useful Information, 1945?
7. Flow of Merrimack River at Boott River Gauge, Oct. 10, 1943
8. Merrimack Valley Flood Control- Determination of Basin Design Flood, August 1946
9. Observations at the Lower Locks in Lowell, Mass. June 1939- August 1945 †
10. Observations at the Swamp Locks, March 1942 – May 1948 †
11. Pump no. 1 & 2 †
12. Tremont Gates, October 19, 1948 †
13. Mill Memoranda- F.F. B. August 1880-May 1889, W.W.S. July 1889- November 1891, "3rd Book" †

3. Mill Memoranda

Box 18 (5.0" Legal size)
Folder:
1. Mill Memoranda, Nov. 1891- June 1896, "No. 4 W.W.S."
2. Mill Memoranda, June 1896-October 1902, "No. 5- W.W.S."

D. Daily Field Notes

1. General Notebooks

Box 19 (7.5x11x4.5")
Folder:
1. Clayton's Octavo Diaries, 1863
2. General Records (illegible) 1922-23
3. Untitled, 1839
4. Untitled, 1843
5. Untitled, 1844-45
6. Untitled, 1863
7. Untitled, 1929
8. Untitled, Measurements About Boott Blocks of Houses
9. Untitled, No Date
10. Untitled, No Date
11. Untitled, No Date
12. Untitled, No Date
13. Untitled, No Date
14. Untitled, No Date

[22] *See also* materials in Addendum.

2. Day Books

Box 19 (7.5x11x4.5")
Folder:
15. Untitled, Day Book, 1843
16. Untitled, 1939-40
17. Untitled, Day Book, 1940

3. Work Records

a.) Buildings

Box 19 (7.5x11x4.5")
Folder:
18. Tremont Mills Rebuilding, June 26-Aug.7, 1862. No. 2, Hiram F. Mills, Asst. Engineer
19. Tremont Mills Rebuilding, Aug.7- Sept. 26, 1862, No. 3, Hiram F. Mills, Asst. Engineer
20. Tremont Mills Rebuilding, Dec. 4, 1862- , No. 6, Hiram F. Mills, Asst. Engineer

b.) Bridges

Box 19 (7.5x11x4.5")
Folder:
21. Bridge Street Bridge Near Boott Mill, Lowell, Mass., 1897-1917
22. Broadway Bridge Near Guard Locks, Lowell, Mass., 1847-1916
23. Central Street Bridge, Lowell, Mass., 1897-1917
24. East Merrimack Street Bridge Near Prescott Mill, East Merrimack Street Bridge, Lowell, Mass., 1897-1917
25. High Bridge Near Little Canada, Lowell, Mass., 1897-1917
26. Merrimack St. Bridge Between Suffolk and Hanover Streets, Lowell, Mass., 1897-1917
27. Pawtucket Street Bridge Near Vesper Boat House, 1897-1917
28. Race Street Bridge and Merrimack Street Bridge Over Merrimack Canal, 1899-1916
29. School Street Bridge Near Gas House, Lowell, Mass., 1897-1916
30. Suffolk Street Bridge Near Suffolk Mill, Lowell, Mass., 1897-1917
31. Thorndyke Street Bridge

4. Rainfall/Temperature

Box 20 (7.5x11x4.5")
Folder:
1. Dec. 12, 1860 – Dec. 31, 1864, Account of Weather (ripped label)
2. Precipitation Records, June 1846-October 1852
3. Swamp Locks Dam, Temperature and Rainfall Records, March 1919
4. Temperatures and Precipitation, Dec. 1952- June 1959

5. Water Level/Measurements

Box 20 (7.5x11x4.5")
Folder:

5. Appleton & Hamilton Flume, Aug. 22, 1899-Aug. 15, 1900, Full
6. Appleton and Hamilton Flume Book, July 24, 1900-Oct. 8, 1900, Regular Flume and Flume Just Below Appleton Counting Room Appleton & Hamilton Water Measurements, Flume, Sept. 9, 1896-Aug. 16,1898 [Book 3 of 7 in bundle]
7. Appleton & Hamilton Water Measurements, Appleton Turbines, Aug 25, 1896-Feb. 26, 1897 [Book 2 of 7 in bundle]
8. Appleton & Hamilton Water Measurements, Flume, Feb. 26 1897-Aug. 23, 1899 [Book 5 of 7 in bundle]
9. Boott & Mass. Flume Measurements, Mass. Flume Oct. 19, 1896-Nov. 8, 1897 [Book 4 of 5 in bundle]
10. Boott & Mass. Water Measurements, Boott Flume, Nov. 8, 1897-Nov. 15-1898 [Book 7 of 15 in bundle]
11. Boott & Mass. Flume Measurements, Mass. Flume, Nov. 8, 1897-July 28, 1899 [Book 8 of 15 in bundle]
12. Boott & Mass. Water Measurements, Boott Flume, Oct. 19, 1898-March 9, 1900 [Book 9 of 15 in bundle]
13. Boott & Massachusetts Water Measurements, Boott Turbine, June 1892 – Aug. 11, 1899 [Book 1 of 15 in bundle]
14. Boott & Mass. Water Measurements, Mass. Turbines, Nov. 7, 1895-Aug. 13, 1897 [Book 2 of 15 in bundle]
15. Boott & Massachusetts Water Measurements, Boott Flume, Apr. 29, 1896-July 9, 1897 [Book 3 of 15 in bundle]
16. Boott & Massachusetts Water Measurements, Boott Flume, July 9, 1897-Aug. 3, 1898 [Book 5 of 15 in bundle]
17. Boott & Mass. Water Measurements, Mass. Flume, From Aug. 13, 1897-July 28, 1899 [Book 6 of 15 in bundle]
18. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, From Gauge Back of the Boott Cotton Mills in Merrimack River
19. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, From Gauge Back of the Lawrence Mfg. Co.'s Mills in Merrimack River
20. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers from Gauge Back of the Massachusetts Cotton Mills in Concord River
21. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, from Gauge Back of Merrimack [illegible] Co. Mills
    Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, From Gauge in Merrimack River Above Guard Gates of the Northern Canal
22. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, Wooden Gauges Above and Below the Dam on Concord River at the Middlesex Co. Mills

23. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, Wooden Gauge in Concord River at the Foot of the Lower Locks
24. Comparison of the Heights of Water at Several Points in the Merrimack and Concord Rivers, Wooden Gauge at Hunts Falls on the South Side of Merrimack River about 114 feet Below the Line of City Pipe Which Crosses the River
25. Comparison of the Telehydrobarometer Dials at the Office and the Pawtucket Dam, Kept at the Office, 1904, 1905, 1906
26. Comparison of the Telehydrobarometer Dials at the Office and the Pawtucket Dam, Kept at the Office Jan. 1, 1900, Jan 1, 1901, 1902, 1903, 1904, J. C. Hamm
27. Flume in Middlesex Company's Race, May 27, 1898-Nov. 7, 1899 [Book 12 of 15 in bundle]
28. Flume Measurements at Lowell Machine Shop From May 5 1899-Nov. 1900

Box 21 (7.5x11x4.5")
Folder:

1. Foot of Cromwells Falls, Aug. 1844, Head of Cromwells Falls, Aug. 1844, Mouth Nashua River, Aug. 1844 (separate notebooks)
2. Hamilton & Appleton Water Measurements, Appleton Turbines, Aug. 23, 1896-[illeg.] 26, 1891 [Book 1 of 7 in bundle]
3. Hamilton & Appleton Water Measurement [illeg.] Turbine, Oct. 24, 1896 – Nov. 17, 1899 [Book 4 of 7 in bundle]
4. Hamilton & Appleton Water Measurements, Hamilton Turbine [illeg.] 1894 to May 31, 18 [sic] [Book 10 of 15 in bundle]
5. Hamilton & Appleton Water Measurements from Apr. 1897 to Nov. 1899 [Book 6 of 7 in bundle]
6. Hamilton & Appleton Water Measurements, Flume, Oct 11, 1898-Apr. 27, 1900, Full [Book 11 of 15 in bundle]
7. Hamilton Turbines 1,2,3,4,5,6,7,8,9 and 10, From Nov. 16, 1897-Nov. 17, 1899 [Book 7 of 7 in bundle]
8. Lowell Machine Shop, Measurement at Flume in Nos. 1 & 2 Race, May 5, 1899-Nov. 1900
9. Morris Special, Mass and Prescott, Middlesex, Apr. 29, 1846 – Mar. 9, 1900, E. H. Morris [Book 13 of 15 in bundle]
10. Noon Readings, January 1, 1926 [1927]
11. Regular Flume and Flume Below Appleton Counting Room, Appleton and Hamilton Flume Book, Aug. 15, 1900-Oct. 8, 1900, Full

6. Surveys

Box 21 (7.5x11x4.5")
Folder:

12. 101, July 14, 1895-Aug. 19, 1897

13. 102, Transit Book No. 2, May 7, 1896-Oct. 23, 1898 [M.S. Army]

14. 103, Transit Book No. 3, Apr. 26, 1896-1898
15. 104, May 16, 1897-Oct. 30, 1898
16. 105, Oct. 15, 1898-May 8, 1910
17. 106, July 1898-Nov. 17, 1901 [G.W. Mansur]
18. Transit Book 107, Hunt's Falls, July 17, 1899-Aug. 25, 1900
19. 109, Apr. 29, 1900-Oct. 31, 1909

Box 22 (8.5x11x5")
Folder:

1. No. 111, Tape Survey at Suffolk Mfg. Co. & Merrimack Mfg. Co., also Merrimack River Survey
2. No. 112, Containing Notes of New (1878) Pipe Lines and Sprinkler Branches: Also, Notes of Surveys, Levels, etc., Taken by A. W. Hunking
3. No. 113, Tape Survey at Merrimack, Lawrence and Lawrence Sec. Triangulation, Notes
4. No. 114, Surveys, A, Pawtucket Canal, Long Island, Pawtucketsville Swamp Locks, Lowell M. Shop
5. No. 115, Boott Cotton Mills, Merrk [sic] River Triangulation, Mass. Cotton Mills, Middlesex Co. Lower Lakes Basin
6. No. 116, Survey's Nortern [sic] Canal, Pawtucket Dam to Pawtucket St., Pawtucket Canal, Merrimack River-Thorndike Street
7. No. 117 Survey's at Tremont & Suffolk, Appleton
8. No. 118 Surveys at Stackpole St., 1893-1903
9. Transit Book No. 120, Merrimack Penstock Survey, Concluded, Dec. 1901 to
10. 1845-1847
11. Suncook Profiles, July 1923, Suncook Storage, Road Profiles
12. Untitled, 1832-1856
13. Untitled, 1836-37
14. Untitled, 1894
15. Untitled, No Date
16. Untitled, No Date

7. Level Books

Box 23 (7.5x11x4.5")
Folder:

1. Level Note Book No. 1
2. Level Book No. 2
3. Level Book No. 3
4. Level Book No. 4
5. Level Book No. 5
6. Level Notes Book No. 6

7. [Level Book] No. 7
8. [Level Book] No. 8
9. [Level Book] No. 9
10. [Level Book] No. 10
11. [Level Book] No. 11
12. [Level Book] No. 12
13. [Level Book] No. 13
14. Level Book 14
15. Level Book 15
16. Level Book 16
17. Level Book 17
18. Level Book 18
19. Level Book 19
20. Level Book 20
21. Level Book 21
22. [Level Book] 22

Box 24 (7.5x11x4.5")
Folder:
Level Book 23
Level Book 24
Level Book 25
Level Book 26
[Level Book] 27
[Level Book] 28
[Level Book] 29
[Level Book] 30
Level Book 31
Level Book 32
Level Book 33
Level Book 34
Level Book 35
Level Book 41
Level Book 40
Level Book 43
Level Book 44
Level Book 45
Level Book 47
Level Book 48

Box 25 (8.5x11x5")
Folder:
1. Level Book 49
2. Level Book 51

3. Level Book 52

8. Experiments

Box 25 (8.5x11x5")
Folder:
4. Experiments on the Loss of Head - Boott Canal Gauge
5. Experiments on the Loss of Head – Boott Penstock Gauges, Dec. 1871-Nov. 1874
6. Experiments on the Loss of Head – Boott Penstock Gauges, [No Date]
7. Experiments on the Loss of Head – Boott Wheelpit Gauges, Dec. 1871 – Nov. 1874
8. Experiments on the Loss of Head – Boott Wheelpit Gauges, July 1872
9. Experiments on the Loss of Head – Canal Gauge Opposite Mass. Counting Room

11. From "James B. Francis Waste books No. 7." (Removed from Box 7, Folder 4.)
    James B. Francis Waste books No. 7 – 2 Receipts.
12. From "James B. Francis Waste books No.9." (Removed from Box 7, Folder 5.)
    James B. Francis Waste books No. 9 – Scrap of paper w/numbers.
    James B. Francis Waste books No. 9 – Receipt.
13. From "James B. Francis Waste books (No.10.)" (Removed from Box 8, Folder 1.)
    James B. Francis Waste books No.10 – Note card.

14. From "James B. Francis Waste books, 1861 – 1866 (No. 11)." (Removed from Box 8, Folder 2.)
    Note regarding "Shingle roof of building over waste bays on Northern Canal."
    Note to James B. Francis from O.H. Moulton.
    Note headed "Fishways – remove ledge that was blasted."
15. From Tables, Miscellaneous, √ 2gh √ h/h' (Removed from Box 11, Folder 1.)
    Original measurements, sketches etc.
    Numerical Tables.
    √ h/h', √ h' = 21. From Tables, Miscellaneous, √ 2gh √ h/h'
    √ h'/h or √ 21/x From Tables, Miscellaneous, √ 2gh √ h/h'
    √ h/h' of √ x/36
16. From Water Measurements – July 1852. (Removed from Box 12, Folder 3.)
    Note.
17. From Turbines – Merrimack MFG Co. – Design Mar. 1856- Jun. 19 1862. (Removed from Box 14, Folder 5.)
    Correspondence.
    Fragment of note card.
    Scrap with equations.
18. From Franklin Forbes – Vol. 1, Oct. 15, 1845 – March 30, 1846. (Removed from Box 16, Folder 1.)
    Note reading "F. Forbes Wastebooks."
19. From Pump No. 1 & 2, 1879 – 1910. (Removed from Box 17, Folder 11.)
    Label from "Pump No. 1 & 2."
    Note card from "Pump No. 1 & 2."
    Blueprint Drawing of the Lawrence Pumps.
20. From Mill Memoranda – F.F.B. August 1880 – May 1889, W.W.S. July 1889 – November 1891, "3rd Book. (Removed from Box 17, Folder 13.)
    Flyer from "Mill Memoranda – F.F.B. August 1880 – May 1889..."
21. From Work Notes – C. Robert Libby- 1910

Box 2 (17x 21")
Folder:

From "Experiments – Dynamometer, May – Nov. 1850. (Removed from Box 9, Folder 5.)
Notes.

5. Materials from file 1012.04[14] (Appendix A, Part 1 of 2)
6. Materials from file 1012.04[14] (Appendix A, Part 2 of 2)
7. Materials from file 1012.04[14] (Appendices B-G)

Oversize Box 12 (23" x 30" x 3" flat box)
Folder:

1. Materials from files 1012.04[15] – 1012.04[17]
2. Materials from file 1012.05
3. Materials from file 1012.06[01] (Part 1 of 2)
4. Materials from file 1012.06[01] (Part 2 of 2)
5. Materials from file 1012.06[02] (Part 1 of 2)
6. Materials from file 1012.06[02] (Part 2 of 2)

Oversize Box 13 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1012.08[01]
2. Materials from files 1012.08[02] – 1012.08[03]
3. Materials from file 1012.09
4. Materials from file 1012.10[01] (Part 1 of 2)
5. Materials from file 1012.10[01] (Part 2 of 2)
6. Materials from file 1012.10[02]

Oversize Box 14 (23" x 30" x 3" flat box)
Folder:
1. Materials from files 1012.12 – 1012.15
2. Materials from file 1012.16[01] (Part 1 of 2)
3. Materials from file 1012.16[01] (Part 2 of 2)
4. Materials from file 1012.16[02]
5. Materials from file 1012.18[01] [Oversize folder 1 of 2]
6. Materials from file 1012.18[01] [Oversize folder 2 of 2]

Oversize Box 15 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1012.20[01]
2. Materials from file 1012.20[04]
3. Materials from file 1012.21
4. Materials from file 1012.22 (Part 1 of 3)
5. Materials from file 1012.22 (Parts 2 & 3 of 3)

Oversize Box 16 (23" x 30" x 3" flat box)
Folder:
1. Materials from files 1013[02] – 1015[04]
2. Materials from file 1015.1[01] (1912-1916)
3. Materials from file 1015.1[01] (1917-1921)
4. Materials from file 1015.1[01] (1922-1925)
5. Materials from file 1015.1[01] (1926-1932)

Oversize Box 17 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1015.1[02]

2. Materials from file 1016[01]
3. Materials from file 1017 (Part 1 of 2)
4. Materials from file 1017 (Part 2 of 2)
5. Materials from file 1018
6. Materials from file 1019

Oversize Box 18 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1020
2. Materials from file 1022[01]
3. Materials from files 1023 – 1029
4. Materials from files 1030[02] – 1035
5. Materials from file 1036[01]

Oversize Box 19 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1036[02] (Part 1 of 2)
2. Materials from file 1036[02] (Part 2 of 2)
3. Materials from file 1036[03]
4. Materials from file 1036[04]
5. Materials from file 1036[05]

Folder:
1. Materials from file 1036[06]
2. Materials from file 1036[07] (Part 1 of 2)
3. Materials from file 1036[07] (Part 2 of 2)
4. Materials from files 1036[08] – 1037
5. Materials from file s1038[02] – 1039

Oversize Box 21 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1040[02]
2. Materials from file 1040.01
3. Materials from files 1040.02 – 1040.04
4. Materials from file 1040.05 (Part 1 of 2)
5. Materials from file 1040.05 (Part 2 of 2)

Oversize Box 22 (23" x 30" x 3" flat box)
Folder:
1. Materials from files 1040.06 – 1040.07
2. Materials from files 1040.08 – 1040.09
3. Materials from files 1040.10 – 1041[02]

4. Materials from file 1042
5. Materials from file 1046
6. Materials from files 1047 – 1049

Oversize Box 23 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1050
2. Materials from file 1051[01] (Part 1 of 2)
3. Materials from file 1051[01] (Part 2 of 2) [Oversize folder 1 of 2]
4. Materials from file 1051[01] (Part 2 of 2) [Oversize folder 2 of 2]

Oversize Box 24 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1051[02] (Part 1 of 2)
2. Materials from file 1051[02] (Part 2 of 2)
3. Materials from file 1053[02]
4. Materials from file 1054

Oversize Box 25 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1055[01] (Part 1 of 2)
2. Materials from file 1055[01] (Part 2 of 2)
3. Materials from files 1055[02] – 1056
4. Materials from files 1057 – 1062
5. Materials from file 1065

Oversize Box 26 (23" x 30" x 3" flat box)
Folder:
1. Materials from files 1071[01] – 1073[01]
2. Materials from file 1073[02] (Part 1 of 2)
3. Materials from file 1073[02] (Part 2 of 2)
4. Materials from files 1073[03] – 1074
5. Materials from file 1075[02]

Oversize Box 27 (23" x 30" x 3" flat box)
Folder:
1. Materials from files 1076 – 1076.2[01]
2. Materials from file 1076.2[02]
3. Materials from file 1077[06] (Parts 1 & 2 of 5)
4. Materials from file 1077[06] (Parts 3-5 of 5)
5. Materials from files 1077[07] – 1078[01]

Oversize Box 28 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1078[02]
2. Materials from file 1080[01]
3. Materials from file 1080[03]
4. Materials from files 1080-A – 1080.1[01]
5. Materials from files 1080.1[02] – 1082

Oversize Box 29 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1082.1
2. Materials from files 1082.2 – 1083
3. Materials from files 1084 – 1085[03]
4. Materials from files 1086 – 1090
5. Materials from files 1092.01 – 1092.02

Oversize Box 30 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1092.05
2. Materials from file 1092.08
3. Materials from file 1092.09[01]
4. Materials from files 1092.09[02] – 1092.11
5. Materials from file 1092.12

Oversize Box 31 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1094
2. Materials from "Correspondence from Howard M. Turner to S. Stanley Kent and Flood Hydrographs"
3. Materials from file 1095[02] (Parts 1-3 of 4)
4. Materials from file 1095[02] (Part 4 of 4) – 1095[03]
5. Materials from file 1095-1 [Oversize folder 1 of 2]
6. Materials from files 1095-1 [Oversize folder 2 of 2] – 1096

Oversize Box 32 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1097[03] [Oversize folder 1 of 2]
2. Materials from file 1097[03] [Oversize folder 2 of 2]
3. Materials from file 1100[02]
4. Materials from file 1100[03]
5. Materials from file 1100[04]

Oversize Box 33 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1100-1
2. Materials from file 1107
3. Materials from files 1108 – 1109
4. Materials from files 1113 – 1114[02]
5. Materials from files 1114[03] – 1114.14
6. Materials from files 1114.15 – 1116[02]

Oversize Box 34 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1117[01]
2. Materials from file 1118[01]
3. Materials from files 1118[02] – 1118.1[03]
4. Materials from file 1119[01] (Part 1 of 2)
5. Materials from file 1119[01] (Part 2 of 2)
6. Materials from file 1119[02]

Oversize Box 35 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1119-A[01] (Part 1 of 2)
2. Materials from file 1119-A[01] (Part 2 of 2)
3. Materials from file 1119-A[02]
4. Materials from file 1119-A[03]
5. Materials from file 1119-A[11]
6. Materials from file 1119-A[13]

Oversize Box 36 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1122
2. Materials from file 1125[01]
3. Materials from file 1126[07]
4. Materials from files 1127[07] – 1127[08]
5. Materials from files 1127[09] – 1127-0

Oversize Box 37 (23" x 30" x 3" flat box)
Folder:

1. Materials from files 1127.002 – 1127.006
2. Materials from files 1127.008 – 1127.025
3. Materials from files 1127.030 – 1127.067
4. Materials from files 1127.074 – 1127.080
5. Materials from files 1127.084 – 1127.086
6. Materials from files 1127.089 – 1127.103-H/1127.104

Oversize Box 38 (23" x 30" x 3" flat box)
Folder:

1. Materials from file 1128[03]

2. Materials from file 1128[04]
3. Materials from files 1128[05] – 1129-A
4. Materials from files 1130 – 1133
5. Materials from files 1136 – 1144

Oversize Box 39 (23" x 30" x 3" flat box)
Folder:
1. Materials from file 1148
2. Materials from files 1151 – 1152[01]
3. Materials from file 1153 (Part 1 of 2)
4. Materials from file 1153 (Part 2 of 2)
5. Materials from files 1154 – 1155[01]
6. Materials from files 1155[02] – 1156

Rolled Material

Oversize Box 40 (43" x 6" x 6" box)
1. Item from "Director's and Executive Committee Records, Vol. 7, 1921 – 1939"
2. Item from file 1065

Oversize Box 41 (12" x 5" x 3" box)
1. Item from file 1114.14

Map Folder Materials

Folder:
1. Materials from file 1001[05]
2. Materials from file 1003[01]
3. Materials from file 1004
4. Materials from files 1008 – 1008.1
5. Materials from file 1009[07]
6. Materials from file 1012.04[06]
7. Materials from file 1012.04[14] (Appendix A, figures 4, 32, 34-37)

9. Materials from file 1012.04[14] (Appendices B-E)
10. Materials from files 1012.04[16] and 1012.0[17]
11. Materials from files 1012.05 – 1012.08
12. Materials from file 1012.16[02]
13. Materials from file 1022[01]
14. Materials from file 1036[08]
15. Materials from files 1038[02] – 1038.1
16. Materials from files 1040.03 – 1045
17. Materials from files 1055[01] – 1060

18. Materials from files 1077[07] – 1078[02]
19. Materials from files 1082.1 – 1095-1
20. Materials from files 1097[03] – 1109
21. Materials from files 1114[01] – 1118[02]
22. Materials from file 1119-A[13]
23. Materials from files 1127.006 – 1127.016
24. Materials from files 1127.028 – 1127.089
25. Materials from files 1128[04] – 1133

Phase 2 and 3 Oversize Materials

Oversize Material

The following is oversize material removed from Series III. Physical Data of Canal Operations.

Box 1 (15”x11.5”x1.5” Flat Box)
Records, 1884-1891 (Vol. 10a) (Removed from Box 1 Folder 4)

Box 2 (15” x 11.5” x 1.5” Flat Box)
Records 1877-1882 (Vol. Q) (Removed from Box 3 Folder 4)

Box 3 (15”x 11.5” x 3” Flat Box)
Day Book 1871-1876 (Removed from Box 6 folder 3)

Box 4 (15”x 11.5” x 3” Flat Box)
Day Book 1876-1881 (Removed from Box 6 Folder 4)

Box 5 (15”x 11.5” x 3” Flat Box)
Day Book 1881-1892 (Removed from Box 6, Folder 5)

Box 6 (18.5”x 14.5” x 3” Flat Box)
Record of Locks and Canals Reservoir, July 1920- February 1931 (Removed from Box 10 Folder 9)

Box 7 (15”x 11.5” x 1.5” Flat Box)
Tables- Water Flowing over Weirs (Removed from Box 11 Folder 5)

Box 8 (15”x 11.5” x 1.5” Flat Box)
Tables- Water Flowing over Weirs (Removed from Box 11 Folder 6)

Box 9 (18.5”x 14.5” x 1.5” Flat Box)
Mills- Floor Plan and Property Surveys. (Removed from Box 14 Folder 1)

Box 10 (15”x 11.5” x 1.5” Flat Box)

Tables-Appleton Co. (Removed from Box 14 Folder 6)

Box 11 (15”x 11.5” x 1.5” Flat Box)
Tables- Boott Cotton Mills (Removed from Box 14 Folder 7)

Box 12 (15”x 11.5” x 1.5” Flat Box)
Tables- Hamilton MFG Co. (Removed from Box 14 Folder 8)

Box 13 (15”x 11.5” x 1.5” Flat Box)
Tables- Lawrence MFG. Co. (Removed from Box 14 Folder 9)

Box 14 (15”x 11.5” x 1.5” Flat Box)
Tables- Lowell Machine Shop (Removed from Box 14 Folder 10)

Box 15 (15”x 11.5” x 1.5” Flat Box)
Tables- Mass. Cotton Mills (Removed from Box 14 Folder 12)

Box 16 (15”x 11.5” x 1.5” Flat Box)
Tables – Merrimack MFG Co (Removed from Box 14 Folder 13)

Box 17 (15”x 11.5” x 1.5” Flat Box)
Tables- T&S Mills (Removed from Box 14 Folder 14)

Box 18 (15”x 11.5” x 1.5” Flat Box)
Miscellaneous Tests etc. 1891-95 (no. 11) (Removed from Box 14, Folder15)

Box 19 (15”x 11.5” x 1.5” Flat Box)
Turbine Tests Etc. 1846-68 (Vol. E) (Removed from Box 14, Folder 16)

Box 20 (15”x 11.5” x 1.5” Flat Box)
Turbine Tests Et. 1868- 77 (Vol. L) (removed from Box 14 Folder 17)

Box 21 (15”x 11.5” x 1.5” Flat Box)
Records of rainfall kept by props. Locks and Canals at guard gates of Northern Canal Records of Temperatures kept by Props. Locks and Canals at Pawtucket Dam. Records of Temperatures kept by Props. Locks and Canals at Old Guard Locks (Removed from Box 17 Folder 4)

Box 22 (15”x 11.5” x 1.5” Flat Box)
Water Measurements, Tabulations, Diagrams, and General Information (Removed from Box 17 folder 5)

Box 23 (15”x 11.5” x 1.5” Flat Box)
Observations at the Lower Locks in Lowell, Mass. June 1939-August 1945 (Removed from Box

17 Folder 9)

Box 24 (15”x 11.5” x 1.5” Flat Box)
Observations at the Swamp Locks, March 1942 – May 1945 (Removed from Box 17 Folder 10)

Box 25 (15”x 11.5” x 1.5” Flat Box)
Termont Gates, October 8, 1868-October 19, 1948 (Removed from Box 17 Folder 12)

Box 26 (15”x 11.5” x 1.5” Flat Box)
Index to books kept by the *Proprietors of the Locks and Canals on Merrimack River*, Containing Copies of and extracts from Deeds of Real Estate, December 22, 1862 (Removed from Box 26 Folder 27)

The following is material removed from Series IV. Deeds, Series V. Flowage Records and Series IV. Tax Records.

Box 27 (17 x 11½ x 3 ½)
Folder:
1. Material from Deeds 4, 5, 6, 15, 21, 26, 28
2. Material from Deeds 33 (2 documents), 34, 45, 51, 52
3. Material from Deeds 79, 90, 92, 94, 96, 104
4. Material from Deeds 105, 106, 113, 118 (2 Documents), 125, 129
5. Material from Deeds 131, 133, 134, 135, 136, 138
6. Material from Deeds 140, 143, 145, 146, 147, 153
7. Material from Deeds 154, 155, 157, 167, 171, 172, 175
8. Material from Deeds 176, 178, 183, 188, 245
9. Material from Deeds 248, 252, 279, 313, 319, 325
10. Material from Deeds 328 (2 Documents), 332
11. Material from Deeds 333, 335, 339, 345, 346 (2 Documents)
12. Material from Deeds 352, 365, 374, 379, 380
13. Material from Deeds 381, 382, 387, 393, 396, 400
14. Material from Deeds 401, 403, 427, 556
15. Material from Deeds 561, 583, 585, 591, 674
16. Material from Deeds 703, 718, 806, 956, 1015, 1016

Box 28 (17 x 11½ x 3 ½)
Folder:
1. Material from Deeds 1050, 1083, 1085, 1137, 1177, 1187
2. Material from Deeds 1190, 1250, 1267, 1269, 1271, 1279
3. Material from Deeds 1312, 1318, 1330, 1343, 1349, 1383, 1384
4. Material from Deeds 5198, 5310, 5314, 5333, 5337, 5338
5. Material from Deeds 5346 (2 documents), 5347, 5349, 5350

6. Material from Deeds 5351, 5355, 5373, 5374, 5375, 5376

7. Material from Deeds 5377, 5378, 5390, 5401, 5409
Material from Deeds 5410, 5415, 5539, 5784, 5800B

Box 29 (20½ x 16½ x 1½)
Folder:
1. Material from Deeds 41, 55, 89, 93, 98, 100
2. Material from Deeds 124, 130, 148, 158, 159, 168, 179
3. Material from Deeds 181, 187, 276, 285, 288, 290
4. Material from Deeds 311, 350, 362, 374, 375, 389 (2 documents)

Box 30 (20½ x 16½ x 1½)
Folder:
1. Material from Deeds 390, 402, 403, 413, 416, 417 (2 Documents)
2. Material from Deeds 419, 420, 422, 423, 424, 425, 426
3. Material from Deeds 447, 451, 453, 456, 457, 540

Box 31 (20½ x 16½ x 1½)
Folder:
1. Material from Deeds 548, 549, 555, 561, 563
2. Material from Deed 583
3. Material from Deed 592
4. Material from Deeds 603 (2 documents), 604, 605 (3 documents)
5. Material from Deed 615
6. Material from Deeds 669, 677, 697, 704
7. Material from Deeds 720
8. Material from Deeds 728, 729, 795, 796, 804

Box 32 (20½ x 16½ x 1½)
Folder:
1. Material from Deed 837
2. Material from Deeds 942, 943, 945, 950, 993, 994
3. Material from Deeds 1008, 1017, 1035, 1055, 1103, 1107
4. Material from Deeds 1137, 1161, 1177, 1189, 1191

Box 33 (20½ x 16½ x 1½)
Folder:
1. Material from Deeds 1198, 1218, 1221, 1269, 1270 (2 documents), 1277
2. Material from Deeds 1319, 1320, 1333, 1338, 1358, 1384, 1393 (13 documents)
3. Material from Deeds 5191, 5196, 5359, 5360, 5424, 5783-A
4. Material from Deeds 5788, 5789A, 5807, 5812

Box 34 (28 ¾ x 22 ¾ x 1 ½)
Folder:
1. Material from Deeds 20, 21, 117, 150, 192, 194, 326, 421, 561, 564, 577 (2 documents)
2. Material from Deeds 583, 588 (2 documents), 602-A, 602-B, 602-C, 614, 615, 654, 675, 678

5. Material from Flowage Record 8097
6. Material from Flowage Record 8099
7. Material from Flowage Record 8107
8. Material from Flowage Record 8262
9. Material from Flowage Record 8342

Box 42 (20 ½ x 16 x 1 ½)
Folder:
1. Material from Tax Record, Street Resolution for Colonial Ave
2. Material from Tax Record, Street Resolution for Hanover St.
3. Material from Tax Record, Street Resolution for Merrimack St.
4. Material from Tax Record, General Tax Information on Schedule of Real Estate Owned by PL&C

Box 43 (24 ¾ x 20 ½ x 1 ½)
Folder:
1. Material from Tax Records, Street Resolution for Stackpole Street.
2. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1906
3. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1907
4. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1909

Box 44 (29 x 23 x 1 ½)
Folder:
1. Material from Flowage Records 8172 and 8261

Box 45 (31 x 23 x 3)
Folder:
1. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1912
2. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1913
3. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1914
4. Material from Tax Records, Taxes 1900-1916, Published Collector's Notice, 1915

Box 46 (14 ½ x 18 ½ x 1 ½")
Folder:

The following materials are removed from Series X. Engineers' Files, Series XI. Subject Files, and Series XII. Miscellaneous:

1. Material from Mills "Miscellaneous" File
2. Material from Mills File #33 – Lowell Hospital Photograph, n.d.
3. Material from Mills File #40 – Chart, 1901
4. Velocity Diagram for Boott Mills Waterwheel, 1916[144]
5. Material from *Lowell Sun* File – Plan of Lot 80-0, 1957
6. Material from Model Cities Agency File – "Lowell – A Junk Shop?" *Boston Globe*, 10 December 1972
7. Materials from Administrative Notebook – Schedules of Real Estate, 1945-1958[145]

Box 47 (20 ½ x 24 ½ x 1 ½")

The following materials are removed from Series X. Engineers' Files, Series XI. Subject Files, and Addendum: III. Physical Data of Canal Operations (cont.):

1. Materials from: Mills File #7 (Boott Mills)
   Mills File #33 (Lowell Hospital)
   Mills File #49 (Pontoon Bridge, Automobile Races)
2. Materials from: Mills File #58 (PL&C Free Landing)
   Mills File #62 (Land Negotiations)
   Mills File #74 (Tremont & Suffolk Mills)
3. Materials from Cowley, Charles vs. PL&C (Parts 1 & 6)
4. Material from "Donald Van Greenby" File
5. Material from "Heritage State Park" Files (#1 & #2)
6. Material from Lowell Museum File
7. Balance Sheets, 1971
8. Balance Sheets, 1972
9. Balance Worksheets October 1971-1972
10. Lowell Land Company Charter
11. Materials from Administrative Notebook[146]

Box 48 (22 ½ X 30 ½ X 3")

The following materials are removed from Series X. Engineers' Files, Series XI. Subject Files, and Addendum: III. Physical Data of Canal Operations (cont.):

1. Material from Mills File #81 (Moody Street Feeder)
2. Drawings for Hollingsworth & Whitney Co. Turbines[147]

[144] Moved from Box 101, Folder 5.
[145] Moved from Box 119, Folder 2.
[146] Moved from Box 119, Folder 3.
[147] Moved from Box 101, Folder 2.

3. Drawings of Governors[148] One item too brittle to unfold; one soiled, section missing
4. Clippings re: Creation of Lowell NHP, 1976-1978[149]
5. Materials from [Merrimack] "River Pollution" File[150]
6. "Map of Merrimack River Drainage Area Showing Rainfall and Stream Gaging [sic] Stations," October 1940[151]

Box 49 (14 ½ x 18 ½ x 1 ½")

Journal Kept at Guard Gates [of Pawtucket Dam], May 1947-December 1954

Box 50 (16 ½ x 20 ½ x 1 ½")

[Merrimack River Level Readings from Official Gauge], September 1950 – July 1961

Box 51 (20 ½ x 24 ½ X 3" flat box)

"A. Index Nos. 731-783: Original Indentures, Land & Water Power, 1826-1845 … Also Quit-Claim Deeds. Water Power, December 1, 1853" Some pressure-sensitive tape – untie cover, folder individual sections, slight red rot on covers
"B. Index Nos. 784-1794: Indentures, Dec. 1, 1853 – Mill Powers" Heavily acidified cover pages to indentures

Box 52 (20 ½ X 24 ½ X 3" drop-front box)

"Taxes" Portfolio [Lists and Valuations], 1917-1936[152]
"Taxes" Portfolio [Lists and Valuations], 1905-1918
"Taxes" Portfolio [Lists and Valuations], 1894-1904

Proprietors of the Locks and Canals on Merrimack River, Records, 1792-1947.
Saco-Lowell Shops, Records, 1855-1960.
Tremont and Suffolk Mills, Records, 1831-1936.

APPENDIX A:

ALPHABETIC INDEX OF GENERAL FILES

The following is a photocopy of the alphabetically-listed index compiled by the administrators of the Proprietors of the Locks and Canals of Lowell for the General Files, the original of which can be found in box 94, folder 5. A numerical list also exists and can be found in the same location. It should be noted, however, that while this index is a useful tool, it should not be relied upon unquestionably, in that its accuracy was subject to the peculiarities of its creators and the records to which it refers, to the hardship of time.

Additionally, some manuscript marginalia are not clearly discernable on the following photocopy. Please consult with park staff for assistance if there are any questions about the index.

PREFACE to GUIDE TO PHOTOGRAPHS

This document describes the extensive collection of documentary photographs produced by the Proprietors for their use in creating, maintaining, altering, and expanding their waterpower delivery system to the textile manufacturers of Lowell, Mass., and later to the New England electrical power grid. It includes only that portion of the photographs collection purchased by Lowell National Historical Park. Another portion of the collection was separately donated by the Proprietors to the University of Massachusetts Lowell Center for Lowell History.

The processing of this collection was completed in March 2007 by staff and volunteers at Lowell National Historical Park. These include Dan Walsh as project coordinator and LOWE volunteers Clee A. Ace and Steven Sussman.

Related materials include a large collection Proprietors of Locks and Canals management and operations records at Lowell National Historical Park (LOWE-5058) including an extensive series of Architectural and Engineering Drawings also at Lowell National Historical Park, and a large collection of business records, including the papers of such notable principals as James B. Francis, Uriah A. Boyden, Patrick T. Jackson, Kirk Boott, George W. Whistler, *et al*., at the Baker Library, Harvard Business School.

The PL&C photograph collection may be accessed directly via the NPS Museum Management homepage at www.cr.nps.gov/museum. This guide will be of help in locating the PL&C photographs within the total Lowell National Historical Park cultural resources collection found at that web site.

Researchers may contact the Lowell National Historical Park by phone at 978- 970-5241 for further assistance in accessing and using this material.

INTRODUCTION

The Proprietors of the Locks and Canals on Merrimack River Photograph collection as received by Lowell National Historical Park is an organic collection of 6,770 original photographic prints and copies thereof, 79 film negatives, 9 glass-plate negatives, and 39 glass lantern-slides produced by PL&C between the years 1883 and 1956.

It documents the construction and ongoing maintenance of the first comprehensive industrial water-power delivery system in the United States but beyond that it provides unique insights into the fabric and quality of life of the city of Lowell, Massachusetts, at the height of its industrial development on into its decline. In this respect, it is remarkable in its historical depth and, since it is almost entirely field photography, it is remarkable in its breadth.

As with the other materials received by Lowell National Historical Park from the Proprietors, these photographs were well, if incompletely documented. For this collection, the Proprietors created several finding aids, the largest being the typed 172 page sequential numerical list which may be found herein at Appendix 1. While it stops at the end of the year 1941, it is largely complete. Other finding aids were simple hand-written lists such at that for the X prefix photographs, which may be found herein at Appendix 2. They also began a typed subject list for the sequentially numbered photographs, which runs from A through Me, but was not completed. In addition to being incomplete, it only indexed photographs made between January 1, 1928, and early 1941. It is Appendix 3. At the opposite extreme, groups such as T. D. H. prefix photoprints or the glass lantern-slides or had no indexing at all.

Like the Proprietors' Architectural and Engineering Drawings series, a portion of the photographs was also separately donated to the UMASS Lowell Center for Lowell History. It consists of the glass-plate negative collection, 5 bound volumes of numbered photoprints, a group of prefix-numbered, unbound photoprints, and a group of 709 unnumbered, unbound photoprints later numbered by the Center using their own M-prefix numbering system.

SCOPE AND CONTENT NOTE

Accession number:	LOWE-132.
Catalog numbers:	LOWE 5058 (entire PL&C collection); individual catalogue on page 5.
Quantity/ Storage:	3976 original photographic prints with over 1000 additional copies; 33 glass lantern slides; 19 film negatives; 9 glass plate negatives.
Location:	Lowell National Historical Park, 67 Kirk Street, Lowell, Massachusetts 01852–1029. Phone 978-970-5000.
Description:	This photograph series was produced in the commonly available photographic media and on the commonly available photographic supports of its time. The vast majority of the positive imagery was rendered on paper. The majority of the prints are gelatin prints with a much smaller group of albumen prints and a handful of cyanotypes. The majority of the negative imagery was on cellulose nitrate film and was transferred to safety film by Lowell National Historical Park. The cellulose nitrate originals, which were actively deteriorating, required disposal as hazardous material. However, the negative holdings of LOWE give an uncharacteristic impression of the overall PL&C negative collection. The PL&C historic negative collection at UMASS Lowell Center for Lowell History is definitive on this subject. The negatives, from no.1 to no. 2230 (10/22/1926), are glass plates while those from no. 2231 to the end of the collection are film negatives.

The Photographs as Administered by the Proprietors of Locks and Canals:

The Proprietors of the Locks and Canals on Merrimack River (PL&C) photograph series at Lowell National Historical Park is an organic grouping of 6770 original photographic prints and copies thereof, along with 79 film negatives, 9 glass-plate negatives and 39 glass lantern- slides, produced by PL&C between the years 1883 and 1956.

Basically, it is documentary photography and illustrates both PL&C and textile manufacturing company project work such as new construction, reconstruction, or repair of buildings, dams and canals and their appurtenances, turbine installations and power generation equipment, and streets and bridges, as well as documentation of railroad related issues, and PL&C properties. But to characterize these photographs as simply project documentary photography is to vastly understate its value as a historical record of the urban fabric of Lowell, Massachusetts, during the apex of its development as an industrial city. That function was tangential to PL&C's purposes when they generated these photographs, if it occurred to them at all, but because location photography almost always includes context as well as subject, it almost always illustrates many things other than just its subject. It is that context, rather than simply their subjects, that gives these photographs their unique value as a historical record.

Judging from the various sizes of the photographic prints and negatives they produced, PL&C used more than one camera during the history of this collection. If the prints are, in fact, contact prints then PL&C had at least one 8x10 camera and one 5x7 camera since the vast majority of the prints were produced in these sizes. This is confirmed by the film negatives and glass-plate negatives which were also found in both these sizes. However, in addition to these sizes, there is a group of film negatives in a 2 ¼ x 3 ½ inch format. This implies the existence of another camera but they could also have been produced as half-size negatives on a 5x7 format camera. There are also a few low-resolution snapshot prints at 2 ¾ by 4 ¾ inches from the 1950s included with the larger format prints but they represent the end of the line for photography at PL&C It would seem that PL&C had a staff photographer who knew how to use large-format view cameras and do darkroom work for most of the history of this collection.

The collection was produced in the usual late-19th and 20th century media and supports. The glass-plate negatives are standard format Eastman dry plates. The original film negatives were produced on cellulose nitrate bases but were copied directly onto safety film by Lowell National Historical Park after which the cellulose nitrate originals were disposed of as hazardous material. The majority of the prints are gelatin prints but there are some albumen prints among the earlier photographs. There are also a few cyanotypes.

It should be noted here that the holdings of Lowell National Historical Park represent only one portion of the total PL&C photograph collection. Another portion was separately donated by PL&C to the University of Massachusetts, Lowell. Their holdings

include almost all of the glass plate negatives and some historic prints. The researcher should also note that PL&C staff members integrated photographs into the office files of various departments; their presence is noted in the collection listing for those files (see Vol. I of this finding aid).

P.L. & C. Photographs Numbering Schemes:

The Proprietors of the Locks and Canals on Merrimack River numbered many of its photographs, but not all of them, and among the numbered photographs it employed several different numbering schemes. This implies a subject-group function for each of the different numbering schemes but, except for the two sequential numbering schemes, the HJ prefix numbering scheme, and the X prefix numbering scheme it is not known what broader subject each group represents.

1. The largest numbered group was that represented by a sequential numbering scheme beginning with number 1 and ending with number 3276. It contained interpolated imagery bearing duplicate print numbers with an –A suffix (e.g. 1589 vs. 1589-A) which imagery was often not related to the print whose number was thus used in modified form. Without these interpolations, the original numbering scheme would have been basically chronological; however, the interpolations typically introduced later imagery back into a number sequence of earlier images, thereby interrupting the otherwise chronological character of the sequential numbering. Clearly, this numbering scheme represents the fundamental PL&C photo-documentation.

2. There were also several smaller numbered groups.

> The first consisted of 88 images using Roman numerals beginning with I and ending with LXXXVIII.
>
> The second consisted of 73 images employing a mixed alpha-alpha and alpha-numeric numbering scheme (e.g. A, A-1, BB, YY-1). While not identified as such, this group seems to consist of images of both banks of the Merrimack River.
>
> The third consisted of 72 images using a B prefix (e.g. B-1 through B-72).
>
> The fourth consisted of 23 images using a C prefix (e.g. C-2 through C-24).
>
> The fifth consisted of 16 images using an HJ prefix (e.g. HJ-1 through HJ-16). This is the only small numbered grouping whose purpose or subject is identified. This prefix scheme applies to photo-documentation of a *Special Hamilton* [Mfg. Co.] *Job – December 1921*.
>
> The sixth consisted of 80 images using a T.D.H. prefix (e.g. T.D.H. 1 through T.D.H. 78, plus T.D.H. 15A and 53A).

The seventh consisted of 26 images employing an X prefix (e.g. X-0 through X-25). This prefix scheme applies to *Miscellaneous Images* as noted on the PL&C handwritten X- prefix list of March 31, 1921.

The eighth consisted of at least 654 glass lantern-slides sequentially numbered without prefixes but with some suffixes (e.g. 638a and 638b).

3. There were also three unnumbered groups.

The first consisted of an unnamed album containing 88 unnumbered images from the years 1909 and following which illustrate such subjects as the construction of the new Massachusetts Mills power house and their new cotton storehouse.

The second consisted of an envelope entitled "Fire Protection" containing images primarily of fire hose and pressure tests conducted by PL&C at the various textile mill complexes where they provided water for indoor sprinkler systems and outdoor hydrants.

The third consisted of 708 truly miscellaneous original images in the collection of the UMASS Lowell Center for Lowell History which it, in turn, numbered with an M- prefix followed by a number, the range being M-1 through M-708. There were 31 copies of images that fell into the group which came to Lowell National Historical Park when it purchased the portion of the PL&C collections that it holds.

4. There was also a large group of unnumbered photographs found among the P.L. & C. General Files (LOWE-5058). These were used to illustrate the letters, reports, etc. found in those files. It was in this group that the photo-documentation for several PL&C upper Merrimack River functions was found. These functions include PL&C's reservoirs and pondings, such as Merrymeeting Lake, and their dams, along with PL&C operations at the Lake Company on Lake Winnipesaukee in New Hampshire.[1]

P.L. & C. Photographs Indexes:

PL&C produced typed numerical indexes to its photograph collections through 1941 (see Appendix 1). It also produced a handwritten list of photographs created between 1942 and the end of December 1948 and another handwritten list of X- prefix photographs entitled *Miscellaneous Negatives* dated March 31, 1920 (Appendix 2). In addition, it produced a typed alphabetical subject index to those photographs (Appendix 3). These indexes were found in the PL&C General Files (LOWE-5058) under file number 1031.

The 172 page typed numerical index includes indexes to the B- prefix, C-prefix, and Roman numeral photographs at pages 91 through 93 (B- prefix), page 94 (C- prefix), and pages 95 through 98 (Roman numerals) (Appendix 1). The numerical sequence, which

[1] The Collection Listing for the General Files in Vol. I. notes the locations of photographs integrated into these files.

was interrupted by the insertion of these otherwise unrelated photographs, resumes at page 99 and continues uninterrupted to the end.

The typed alphabetical subject index is partial in that it only covers subject headings from A to Me. The typing stops at Me in mid-page, which suggests that its creation never got beyond that point (Appendix 3).

Ultimate Disposition of the P.L. & C. Photograph Collection:

In October 1996, Lowell National Historical Park purchased the PL&C photographs collection except for the portion that had been donated earlier by the PL&C to the University of Massachusetts, Lowell.

The Collection as Received by Lowell National Historical Park:

1. Seventeen bound volumes of original photographic prints. These comprise two copies of volume no.1; volume no.7; volume no.7-A; volume no.8; and volumes nos. 9 through 15. They contain prints bearing PL&C numbers:

1-213 (vol. 1)
1361-1589-A (vol. 7)
1623A-1695 (duplicate prints, vol. 7-A)
1590-1812 (vol. 8)
1813-2035 (vol. 9)
2036-2260 (vol. 10)
2261-2483 (vol. 11)
2484-2706 (vol. 12)
2707-2927 (vol. 13)
2928-3156 (vol. 14)
3157-3276 (vol. 15)

2. All of the original and copy photographic prints contained in the PL&C General Files (LOWE-5058). There were many duplicate prints from the sequentially numbered print group noted above found within the General Files. However, there were also quite a number of original prints that did not bear any PL&C numbering at all and were largely of subjects relating to PL&C's reservoirs and pondings, and their dams, in New Hampshire along with PL&C operations at the Lake Company on Lake Winnipesaukee.

3. Seven prints from the group of 88 using Roman numerals.

4. Six prints from the group of 73 using the mixed alpha-alpha and alpha-numeric numbering scheme.

5. Twenty three prints from the group of 72 using the B prefix.

6. Fourteen prints from the group of 23 images using the C prefix.

7. Twenty three prints from the group of 80 using the T.D.H. prefix.

8. Twenty six prints, which is a complete set, from the group using the X prefix.

9. Thirty three glass lantern slides from a sequentially numbered group whose highest number among those received was 653.

10. The unnamed album containing 88 unnumbered prints from the years 1909 and following which illustrate such subjects as the construction of the new Massachusetts Mills power house and their new cotton storehouse.

11. Nineteen unnumbered film negatives.

12. Nine unnumbered glass-plate negatives.

The Collection as Processed by Lowell National Historical Park:

Because of the image-bearing capabilities of artifact catalogue records created in the ANCS+ cataloguing system, which has been adopted by the National Park Service for service-wide use, LOWE chose to individually catalogue the PL&C photographs it owns.

Although item level processing is not generally done for archival collections, in the case strong user interest in PL&C images coincided with the capabilities of the cataloguing system to present a compelling argument for item level cataloguing.

Given that all the collections of Lowell National Historical Park can be accessed through the National Park Service web catalogue, item level cataloguing of this collection was the most expeditious way to make all these images available for perusal by researchers nationwide. It also parallels the cataloguing of other imagery in the LOWE collection.

At the item level, each individual image has its own unique ANCS+ catalogue number. These ANCS+ catalogue numbers are separate from and bear no organizational relationship to any numbering schemes employed by PL&C or others. They were applied to each individual image as it was processed, basically, in the order received. However, the PL&C numbers are recorded in the ANCS+ catalogue records in a data field called “other numbers” and are not lost to an image simply because it was given an ANCS+ number upon cataloguing.

In order to facilitate searching the Lowell National Historical Park website by ANCS+ catalogue number, the following list of ANCS+ catalogue number as applied to PL&C imagery is provided:

PL&C photographic prints:

LOWE-7001 through LOWE-9955
LOWE-10026 through LOWE-10099
LOWE-11001 through LOWE-11905
LOWE-11969 through LOWE-11999
LOWE-15544 through LOWE-15547

PL&C glass plate negatives:

LOWE-14529 through LOWE-14537

PL&C film negatives (replicated as inter-positives and film negatives on safety film):

LOWE-10003 through LOWE-10025
LOWE-12565 through LOWE-12575

PL&C glass lantern slides:

LOWE-14515 through LOWE-14528
LOWE-15557 through LOWE-15575

The Collection as Received by UMASS Lowell Center for Lowell History:

The University of Massachusetts Lowell Center for Lowell History received the bulk of the PL&C photographic negatives.

It also received those bound volumes of original photographic prints donated to it before the purchase of the remainder by Lowell National Historical Park. They contain prints originally generated from the negatives noted above.

In addition, it received all 16 images using the HJ prefix (e.g. HJ-1 through HJ-16) representing photo-documentation of a *Special Hamilton* [Mfg. Co.] *Job – December 1921*.

It also received the bulk of the imagery from the other numbered groups of images employing prefixes.

Lastly, it received 708 miscellaneous original images which it then numbered with an M- prefix followed by a number, the range being M-1 through M-708, in order to gain basic intellectual control of these images.

The holdings of the UMASS Lowell Center for Lowell History are not detailed in this finding aid. To access their collection and survey its contents, researchers may contact the Center at 978-934-4000.

Searching the NPS web catalogue for PL&C Photographs:

All of the PL&C imagery at Lowell national Historical Park covered by this finding aid is accessible for perusal through the NPS web catalogue. It can be found via the NPS Museum Management web page at www.cr.nps.gov/museum/. Once there, select Web Catalog from the bar menu. Then select Lowell NHP from the list. The catalogue allows you to Browse or Search. Use the Search function in conjunction with this finding aid.

To search by PL&C numbers as found in Appendix 2, simply type a number into the block provided and strike the search button below. Your selection will appear on the screen. You may also find a second selection. This is because some PL&C photograph numbers have the same number component as some LOWE catalogue numbers. When they do, both selections will appear even though the LOWE catalogue number will have no relationship to the PL&C photograph number.

For example, a search on number 1761 will bring up two records. One is LOWE catalogue number 1761, which is a pharmacist's chemical bottle (catalogued in 1989), the other is LOWE catalogue number 8135, which is PL&C photoprint number 1761 (catalogued in 2000). The two artifacts have nothing to do with each other except that they happen to have one number in common in their respective catalogue records. Both appeared in this sample search but the user of this finding aid would only be seeking the photoprint.

Other PL&C numbers will yield only the PL&C photoprint. A search on number 1672A, for example yields only the PL&C photoprint with that number. That print happens to carry the LOWE catalogue number 7996 but LOWE catalogue numbers do not have alphabetic suffixes so no other item was found in a search for number 1672A.

Searches can also be conducted in the search mode using words rather than numbers. The PL&C titles or captions that appear on the photographs themselves were transcribed literally into the Web Catalogue records, thus, the titles that appear in Appendix 2 should be searchable in the Web Catalogue. However, a word of caution regarding text searches is necessary and it is that the more words used in any given search entry, the longer the search will take. Therefore, it is better to use the fewest number of words possible and to rely on key terms. For example, PL&C photoprint number 363 bears the title "Left shore Merrimack River from north pier of Aiken St. bridge, looking upstream. Shows head of Long Island." If one attempted a search on the entire title, the search would take quite a

long time. If, however, one searched just on the words “Long Island”, the search would be much faster and this photograph would appear in the results along with any others of the same subject.

The database is larger than the body of photographs that appears in the PL&C Index of Photograph Plates, however. Therefore, when doing a broad-based, general search use any term or terms that might lead to the subject being pursued, especially if that subject has a name or its location is known. For example, a search for photographs of Merrymeeting Lake (using the single search term “merrymeeting”) would yield a large number of images outside the numbered series of photographs covered by the PL&C Index of Photograph Plates. In this case the PL&C Index would provide a useful search term but is hardly definitive in and of itself and only a database search would yield the full scope of Merrymeeting Lake imagery in the collection.

A final note on two popular search subjects:

The first is “Little Canada”, the old Franco-American neighborhood that was lost to an urban renewal project. A search of the database under the term Little Canada will yield only a few images but there are actually over thirty images in the collection. The explanation for this is that the term Little Canada was not usually used by the Proprietors to identify the subjects of photographs taken there. This is because they were not photographing a neighborhood but, rather, some much more specific subject, such as a piece of property they might own, which happened to be in that neighborhood. As a result, they typically identified the photograph by the name of the street on which the subject was located and not by the neighborhood in which it is was found. Therefore, the best way to locate Little Canada photographs is by searching street names in that neighborhood. The following streets in Little Canada were photographed by the Proprietors of the Locks & Canals: Aiken Street, Cabot Street, Cheever Street, Coolidge Street, Ford Street, Hall Street, James Street, Moody Street, and Perkins Street.

The second is the “Francis Gate” dam and lock complex. This is current rather than historic nomenclature and, thus, was not used by the Proprietors of the Locks & Canals for that location. They routinely referred to it as the “Old Guard Locks” and that is the search terminology that will yield the desired results.

Appendix 1

PL&C Index of Photograph Plates. This is the sequential numerical list of the main body of glass-plate negatives and their prints created by the Proprietors between 1883 and 1941. It contains the B-prefix sequence (pages 91-93), the C-prefix sequence (page 94), and the Roman numeral sequence (pages 95-98) and is 172 typewritten pages in its entirety. The original is located in the General Files #1031, Box 40, Folders 3-6.

PREFACE to GUIDE TO ARCHITECTURAL AND ENGINEERING DRAWINGS

This document describes the extensive collection of drawings produced or acquired by the Proprietors for their use in creating, maintaining, altering, and expanding their waterpower delivery system to the textile manufacturers of Lowell, Mass., and later to the New England electrical power grid.

The processing of this collection was completed in February 2007 after several years of inventorying and data entry by staff and volunteers at Lowell National Historical Park. These include Dan Walsh as project coordinator, Rebecca Hartwell and Michelle Verfaillie from LOWE park staff, along with LONG volunteers Clee A. Ace, Kathy Dery, and Steven Sussman.

Related materials include a large collection Proprietors of Locks and Canals management and operations records at Lowell National Historical Park (LOWE-5058), a large collection of individually catalogued historic PL&C photographic prints also at Lowell National Historical Park, a small collection of PL&C architectural and engineering drawings as well as historic glass plate negatives and some historic photographic prints at the University of Massachusetts/Lowell Center for Lowell History, and a large collection of business records including the papers of such notable principals as James B. Francis, Uriah A. Boyden, Patrick T. Jackson, Kirk Boott, George W. Whistler, *et al*.

Researchers may contact the Lowell National Historical Park by phone at 978-970-5241 for assistance in accessing and using this material.

INTRODUCTION

The Proprietors of the Locks and Canals on Merrimack River Architectural and Engineering Drawings series holds over 11,000 plans, elevations, renderings, charts, graphs, templates and copies thereof produced by PL&C and its partners and suppliers between the years 1801 and 1987.

It covers all aspects of the design, construction, and ongoing maintenance of the first comprehensive industrial water-power delivery system in the United States and, as such, provides a unique record for what would become the prototypical industrial power delivery system before and into the age of steam and electrical power. It also provides key information for this power delivery system today since the entire system is extant and functioning as a hydropower component of the New England regional electrical power grid.

The collection consists of six separate sub-series of drawings. They are as follows:

1. Assets Division of Boott Mills series: 1295 original drawings and copies covering the period 1828-1987.

2. Lowell Industrial Development Company boiler series: 49 copies covering the period 1948-1950.

3. Maps series: 101 maps, generally published, covering the period 1818-1939.

4. Massachusetts Mills series: 327 original drawings and copies covering the period 1856-1943.

5. Merrimack Valley sewers project of 1948 series: 161 original drawings and copies covering the period 1876-1948.

6. Numbered series: 9218 original drawings and plans covering the period 1801-1980 for original drawings with a group of nine copies of earlier plans covering the period 1729-1794.

Page 9 describes briefly the business relationships of the Assets Division of Boott Mills, the Lowell Industrial Development Company, Massachusetts Mills, and the Proprietors of the Locks and Canals. That description will illustrate why and how these seemingly unrelated drawings series were incorporated into the Proprietors of the Locks and Canals drawings collection.

SCOPE AND CONTENT NOTE

Accession number:	LOWE-132
Catalog number:	LOWE 5058 (PL&C collection); LOWE-6391
Quantity/ Storage:	11151 drawings in: 82 standard map case drawers (flat storage) 14 smaller plans case drawers 147 six foot capped tubes (rolled storage) 2 open shelves (oversize foldered, flat storage)
Location:	Lowell National Historical Park, 67 Kirk Street, Lowell, Massachusetts 01852–1029. Phone 978-970-5000.
Description	This collection was produced in all of the various rendering and copying media and on all of the various drawing supports typically employed throughout the nineteenth and most of the twentieth centuries. Its drawing quality ranges from the near-artistic to the casual and perfunctory. Its supports range from fine all-cotton rag paper and drafting cloth to low quality brittle wood-fiber paper as well as some mylar and acetate film. Several of the early drawings bear the names of such noteworthy figures as James B. Francis, Uriah A. Boyden and George R. Baldwin.

The Collection as Administered by the Proprietors of the Locks and Canals:

The Proprietors of the Locks and Canals on Merrimack River (PL&C) Architectural and Engineering Drawings is an organic series of over 11,000 plans, elevations, renderings, charts, graphs, templates and copies thereof produced by PL&C and its partners and suppliers between the years 1801 and 1987.

It covers all aspects of the design, construction, and ongoing maintenance of the first comprehensive industrial water-power delivery system in the United States and, as such, provides a unique record for what would become the prototypical industrial power delivery system before and into the age of steam and electrical power. It also provides key information for this power delivery system today since the entire system is extant and functioning as a hydropower component of the New England regional electrical power grid.

This collection was produced in all of the various rendering and copying media and on all of the various drawing supports typically employed throughout the nineteenth and most of the twentieth centuries. Its drawing quality ranges from the near-artistic to the casual and perfunctory. Its supports range from fine all-cotton rag paper and drafting cloth to low quality brittle wood-fiber paper as well as some mylar and acetate film. Several of the early drawings bear the names of such noteworthy figures as James B. Francis, Uriah Boyden and George R. Baldwin.

The Drawings Series:

The collection consists of six separate sub-series series of drawings. They are as follows:

1. Assets Division of Boott Mills sub-series: 1295 original drawings and copies covering the period 1828-1987.

2. Lowell Industrial Development Company boiler sub-series: 49 copies covering the period 1948-1950.

3. Maps sub-series: 101 maps, generally published, covering the period 1818-1939.

4. Massachusetts Mills sub-series: 327 original drawings and copies covering the period 1856-1943.

5. Merrimack Valley sewers project of 1948 sub-series: 161 original drawings and copies covering the period 1876-1948.

6. Numbered sub-series: 9218 original drawings and plans covering the period 1801-1980 for original drawings with a group of nine copies of earlier plans covering the period 1729-1794.

There are two broad groups within which these six groups are contained. The first broad group is plans created by and for the PL&C in its functions and includes the Maps sub-series, the Merrimack Valley sewers project of 1948 sub-series, and the Numbered plans sub-series. The

second broad group is plans created by subsidiaries or partners or those created for a purpose outside the functions of the PL&C *per se* and includes the Assets Division of Boott Mills sub-series, the Lowell Industrial Development Company (L.I.D.C.) boiler sub-series, and the Massachusetts Mills sub-series.

Origins, Growth, and Development of the Collection:

First broad group:

The first broad group of drawings is understandable without having to go into a discussion of other or parallel business relationships. It sprang from the needs of the P.L. & C. itself and was created by them for their fundamental business objectives, the provision of water for power production or other industrial processes not related to power production.

The Numbered sub-series is the first and most fundamental of the PL&C drawings collections. It is also the oldest and the largest collection. It contains original drawings dating from 1801 and copies of drawings dating from 1729 and covers every aspect of the creation and maintenance of the water power delivery system, which is the canals, dams, gates, locks, wasteways, and their appurtenant structures, as well as the penstocks, raceways, turbine pits, and turbines themselves, and the equipment necessary to operate them. The last dated drawing is from 1980.

The Maps sub-series is primarily devoted to published maps of the Merrimack River and its watershed, along with published maps of the city of Lowell. There are also a small number of maps dealing with other areas of the country or areas of Massachusetts outside of the Merrimack River watershed. Originally the maps collection was larger and contained maps of other parts of the country or the hemisphere but these were no longer part of the collection when it was received by Lowell National Historical Park. The majority of this collection is from the nineteenth and early twentieth centuries.

The 1948 Merrimack Valley sewers project is unusual in that it is a discrete collection intended to meet a specific short-term objective to document the historic and, what was then, the current water quality of the Merrimack River. That need arose out of an initiative to address, on a regional scale, the problems of sewage and other water-borne waste in the Merrimack River Valley in Massachusetts. It involved federal, state, and local government as well as business and industry and ultimately led to a resolution of what were long standing problems.

Second broad group:

The second broad group requires some further description in order to understand how these sub-series found their way into the P.L. & C. drawings collection.

The Assets Division of Boott Mills represents a partnership involving the Boott Mills and the PL&C that dealt with the real estate assets of former Lowell textile manufacturing companies and in hydropower generation and mill sprinkler-system water delivery. Its real estate interests were in properties at 200 Market Street, at the Foot of John Street (Boott Mills complex), and at 95 Bridge Street (Massachusetts Mills). The majority of this drawings sub-series dates from the period 1950 to1987, which makes it the most recent of the collections.

The Lowell Industrial Development Company represents another partnership, origjnally between Boott Mills and the Merrimack Mfg. Co. As described by Laurence Gross in his work *The Course of Industrial Decline* (p. 232), Boott Mills "…united with the Merrimack [Mfg. Co.] (controlled by the same investors) in the LIDC to buy up the real estate of the Massachusetts Mills, along with its waterpower rights plus those of the Lowell [Mfg. Co.] and Middlesex Mills and the 622 shares of Locks and Canals associated with them." The 49 plans of this sub-series cover the period 1948 to 1950 and relate to the design and installation of a steam turbine boiler by a single contractor. It is the smallest of the drawings collections. There is also a much larger group of L.I.D.C. plans in the Numbered sub-series at shelf/folio number prefix 156- , which nicely illustrates the interrelatedness of the L.I.D.C. and the PL&C but which had no provisions in its structure for this group of boiler plans.

Massachusetts Mills was one of the original 11 textile manufacturing companies and, like Boott Mills, was one of the last to remain in textile production in Lowell. As a partner in its successor, P.L. & C. seems to have inherited the extant Massachusetts Mills drawings collection, probably because it was the most logical partner to hold these drawings in view of the fact that it already maintained a large collection of its own drawings. In any case, this is the only collection of actual mill building plans held by PL&C This is not really surprising since P.L. & C. was less concerned with the actual structures raised by the textile manufacturers for their production purposes than they were with the structures of their own water power delivery system. This sub-series is also unique in that the existence or whereabouts of any other Lowell cotton mill plans are not known and, thus, it represents the only such documentation available.

These business relationships are complex because they are intertwined and involve the same individuals and the same properties. To illustrate the point even further, there was another entity known as the Assets Realization Company (1920-1946. See PL&C General Files), and another known as the Assets Division of L.I.D.C. (1943-1956. See PL&C General Files), and yet another local partnership known as Boott Hydropower, which became a wholly owned subsidiary of Consolidated Hydropower which is, itself, now a subsidiary of Enel, a major Italian-owned electric power company.

PL&C Drawing Sub-series Numbering Schemes:

1. Assets Division of Boott Mills sub-series. This sub-series was not numbered as such by PL&C but was simply held in a map case the contents of whose drawers were identified by drawer labels. Each drawer contained a typed list of abbreviated drawings titles for what was intended to have been its contents but these lists did not use plan numbers. Thus the numbering scheme employed for this sub-series of plans by Lowell National Historical Park (LOWE) staff in creating the database for this drawings sub-series uses a PL&C model, namely, a compound number consisting of an applied drawer number and an applied plan number, e.g. 01-01. In point of fact, many of the plans in this sub-series are copies of plans from other sub-series, such as the PL&C numbered sub-series, copies which bear the plan number of their sub-series of origin but which were not used in the sub-series in which they were found. Those other sub-series numbers are recorded in the database for this sub-series in a field named "Other Numbers".

2. Lowell Industrial Development Company boiler sub-series. This sub-series was not numbered by PL&C but did carry a plan numbering scheme of its creator, the Wickes Boiler Co. of Saginaw, Michigan, e.g. 51838. . This is the numbering scheme that was employed by LOWE staff in creating its database for this sub-series, with the addition of the prefix LIDC, resulting in the plan number LIDC 51838.

3. The Maps sub-series had a numbered list for its contents that was generated by PL&C The list actually consists of seven categories (i.e. Lowell Maps, New Hampshire State Maps, New Hampshire county and city maps, United States Maps, Massachusetts State Maps, Boston Maps, and Other maps) but is numbered continuously from 1 through 54 irrespective of the categorized organizational scheme. This PL&C numbering scheme is the numbering employed by LOWE staff in creating its database for this sub-series, along with the prefix Maps, e.g. Maps 001.

4. The Massachusetts Mills sub-series carries a numbering scheme that was evidently developed by Massachusetts Mills itself and simply left unaltered by PL&C This numbering scheme consists of compound alpha-numeric numbers for each of the plans, e.g. A-43, and seemingly reflects an intended categorized organizational scheme although what its categories may have been is not clear in the absence of any documentation other than the plans themselves. It is also discontinuous in its alphabetic prefixes lacking, as it does, any D-, H-, I-, J-, O-, P-, Q-, or T- through Z- prefix plans. In addition, it is discontinuous in its numbering within any given prefix group. As a typical example, the collection begins with drawing A-43 and goes next to A-47. The whereabouts of drawings A-1 through A-42 or A-44 through A-46 are unknown, as are the whereabouts of any of the other missing numbers within the other existing prefix groups, except for eight drawings still bearing their Massachusetts Mills sub-series numbers, which were renumbered by PL&C and added to their own Numbered sub-series of drawings. This may have been the fate of other missing Massachusetts Mills sub-series plans but without direct evidence there is no point in attempting to deduce what they may have been.

5. The Merrimack Valley sewers project of 1948 sub-series is like the Assets Division of Boott Mills sub-series in that it was not numbered but had typed lists of abbreviated drawings titles which, in this case, were pasted to the exterior of the large envelopes which contained the drawings. Based on the model of the Maps sub-series, the numbering scheme employed for this sub-series of plans by Lowell National Historical Park (LOWE) staff in creating the database for this drawings sub-series uses a simple continuous numbering scheme beginning with 001.

6. The Numbered sub-series is by far and away the largest of the drawings sub-series in this collection and currently bears a numbering scheme that seems to have been developed by PL&C in stages over the course of the 19th century. In its most basic form, it is a compound numero-numeric scheme the first element of which is a “shelf” or folio number separated by a hyphen from a drawing number, e.g. 131-001.

However, as the collection grew, so did the elaboration of the its numbering scheme. Since not all drawings were small enough to be stored flat by PL&C, large drawings had to be stored rolled but weren’t given “shelf” or folio numbers. Instead, they were typically stored in paste-board tubes housed in sheet-metal cases, which PL&C termed “pigeon holes”, and were given compound numbers consisting of “P.H.” prefixes followed by drawing numbers, e.g. P.H. 6-E. As the collection continued to grow, additional storage had to be found and this resulted in a yet another refinement of the numbering scheme.

In the 20th century, at least, PL&C housed its drawings in a plans vault. Evidently, at some point, that vault was expanded since the latest PL&C numbering scheme uses a locator pre-prefix to distinguish between the Upper Vault and the Lower Vault, both of which contained flat and rolled drawings. The upper vault drawings were given a “C-“ pre-prefix, e.g. C-114-1 or C-P.H. 8, while the lower vault drawings were not given any pre-prefix and continued to be numbered as shown above. The necessity of PL&C having to employ the C- locator pre-prefix stems from the

fact that it reused its shelf and pigeon hole numbers and, thus, without a location indicator, one would not know whether any given plan was in an upper or lower vault folio or pigeon hole. Since the same upper and lower vault folio and pigeon hole numbers were used for different drawing topic groups, the possibility for confusion in actual location and the annoying consequences of misfiling would indeed have been a constant problem without a location designator.

That vault expansion point seems to have been reached about the year 1900. The evidence for this is found both in the drawing dates and in the new plan number labels that begin to appear. PL&C procured a type of preprinted paper label which could be affixed to a drawing and had blank spaces following the terms "No." and "Shelf" which were to be filled in with a drawing number and a shelf number. The printer included the year in which the labels were made, along with other proprietary information, on the margins of the label. There are three distinct groups of labels in terms of printing date: 1900, 1909, and 1913. Clearly, a compound-numbering system was in use by 1900 since it is reflected in the preprinted label form itself. In addition, the first appearance of the distinction between the "C-" plans and the non-"C-" plans found in the PL&C typed "Consecutive Index of Drawings" coincides with drawings dated at the turn of the 20th century. What PL&C appears to have done in making the distinction between upper and lower vault drawings was to have consolidated the older drawings in the upper vault and, folio by folio, given the C- designator to them. At the same time, PL&C seems to have instituted a uniform compound plan numbering scheme for new drawings, within which each numbered "shelf"/folio began its own internal sequence of drawing numbers starting with the number 1., e.g. 136-1>, 140-1>, etc., and which superseded an older compound numbering scheme.

It is not clear exactly why PL&C recycled shelf and pigeon hole numbers rather than simply creating a distinct sub-series of numbers for each level of its vault, especially in view of the fact that the shelf and pigeon hole numbers represent subject classifications, e.g. the subject of shelf 132 drawings is Water Wheels while the subject of shelf C-132 drawings is Hydrant Tests. Had PL&C simply given a shelf or folio sequence of 100-199 to the upper vault and 200-299 to the lower vault, with a similar distinction within the P.H. sequences, there would have been no need of yet another prefix in the form of "C-". The existence of this pre-prefix caused no end of difficulty in processing this drawings sub-series since LOWE was not in possession of the documentation explaining it until it received the PL&C Files collection in 1997 and, within the drawings themselves, PL&C had not been consistent in correctly labeling all the "C-" drawings as such while, in its later years, it often mixed "C-" and non-"C-" drawings together rather than storing them separately as was originally intended.

As noted above, the current classified numbering scheme for this drawings sub-series was developed by PL&C but it was not the original numbering scheme, which was characterized by unnecessary complexity. Beginning with number 1, it remained sequential until it reached at least number 4697 before being superseded by the newer scheme. Number 4697 is the last number clearly incorporated into the current shelf/folio or pigeon hole compound-numbering scheme at drawing number C-134-4697. This is also reflected in "Consecutive Index of Drawings". However, a classification mechanism which unfortunately did not allow for plan number growth within its classifications was superimposed on this older sequential PL&C consecutive numbering scheme prior to the use of the "C-" pre-prefix location designators. It resulted in anomalies such as broken plan number sequences within shelf/folio numbers, e.g. C-117-154-188 & 282-342. In this case, since the numbers between 189 and 381 had already been incorporated into shelf/folio C-118, the only thing to do was jump to the next unused sequence of numbers. The point at which

this scheme was introduced seems to have been at the time of the construction of the Northern Canal in 1846-47.

Normally, in a compound numbering scheme of the type originally employed by PL&C, one would expect to see the earliest sequential plan numbers falling within the earliest sequential shelf/folio number. However, that is not the case with these drawings. The earliest shelf/folio number is 105 (currently C-105) but it contains plans numbers 402-535. In fact, it is folio114 (currently C-114) that contains drawings 1-61, followed by folio 115 (currently C-115) which continues with drawings 62-93. Both of these folios were devoted to the topic "Northern Canal. Sections 1 and 2. General Plans. Excavations. Masonry. 1846-47." Thus it seems that earlier classified numbering scheme for this drawings sub-series appeared about 1846 and that it must also have had to incorporate all the earlier drawings which had been generated up that time (over 200 by date from 1801 through 1845). Since James B. Francis was the chief engineer for PL&C at the time of the construction the Northern Canal, he may very well have developed this earlier classified plans numbering system. That could explain why drawing number 1 is a Northern Canal drawing rather than being the earliest drawing generated by PL&C Again, probably in answer to the awkwardness of the original compound numbering scheme, PL&C seems to have instituted, about the turn of the 20th century, a uniform plan numbering scheme for new drawings within which each numbered shelf/folio began its own internal sequence of drawing numbers starting with the number 1., e.g. 136-1>, 140-1>, etc.

PL&C Generated Drawings Collection Indices:

1. **The Card Index File.** This extensive subject index to the collection utilizes typed 4x6 ruled cards and is contained in a hardwood case that was evidently a custom-made by or for PL&C.

Intellectually, it is organized systematically using an alphabetically-arranged controlled subject-indexing vocabulary developed by PL&C. In this respect, it is similar in appearance and organization to library subject catalogues, albeit utilizing a much more restricted indexing vocabulary than Sear's or the Library of Congress List of Subject Headings. The broader subject headings (e.g. Boott Cotton Mills) can have secondary level subject groups within them (e.g. Waterwheels and Equipment) which can have, in turn, tertiary level subject groups within them (e.g. Draft Tubes). Tacked to the inside of the lid of the card file case is a typed list showing the subject-indexing vocabulary and the secondary and tertiary levels beneath whatever primary headings have secondary or tertiary level indexing. The subject cards themselves have either buff or blue colored tab divider cards to indicate their subject categories: buff for a primary subject level, blue for secondary and tertiary subject levels. Their subject headings reflect those of the typed list.

As with library subject catalogues, there can be multiple references in this subject catalogue to the same work since every drawing, like every book, is about more than just one thing. The entries on the subject cards consist of a subject heading at the tops of the cards with plan numbers and short form titles and, sometimes, dates and references to the type of the plan (e.g. BP, for blueprint) or the support of the plan (e.g. TP for tracing paper) listed below.

This was the finding aid that came with the collection when it was received by LOWE in 1989. Processing the collection was made more difficult by this subject index because it acted as only an imperfect check list owing to the existence of multiple entries, which often had conflicting or ambiguous information for the same plan number. For example, questions constantly arose as to

whether the subject card references were to original drawing or to copies of original drawings. In addition, it is not complete in that quite a number of drawings were found in the collection that were not listed in this index.

2. **The Consecutive Index of Drawings Belonging to Proprietors of the Locks and Canals on the Merrimack River.** This plan number index exists in the form of typed letter sized sheets. It functions in the same way as a library shelf list, that is, as a simple first number to last number list of the total plans collection with only one entry per drawing. It came to LOWE in 1997 with the final transaction between PL&C and LOWE for the disposition of the collection and has proven very helpful in resolving anomalies within the drawings collection itself. Its only drawback is that, like the card form subject index, it is not complete in that, again, quite a number of drawings were found in the collection that were not listed in this index (a selection forms Appendix 1).

3. **Other lists.** As noted above, under **PL&C drawings sub-series numbering schemes**, the Assets Division of Boott Mills sub-series, the Maps sub-series, and the Merrimack Valley sewers project of 1948 sub-series each had typed contents lists associated with them showing, at the least, a short form title (Appendices 4 and 5). The Maps sub-series list also numbered the maps starting with 1 and ending with 54. Like the Card Index File and the Consecutive Index, none of these lists was complete and each drawings sub-series contained many more drawings than were shown on its respective list.

Ultimate Disposition of the P. L.& C. Drawings Collection:

In October 1996, Lowell National Historical Park purchased the PL&C Architectural and Engineering drawings collection except for a selection of drawings donated earlier by the PL&C to what was then the Lowell Textile Institute (later incorporated into the University of Massachusetts, Lowell). The PL&C Consecutive Index of Drawings notes, on its Pigeon Hole and Shelf Index Upper Vault page, the shelf/folio numbers whose drawings were donated to the Lowell Textile Institute. They are: shelf/folio C-105, C-106, C-107, C-108, C-109, C-110, C-111, C-112, C-113, C-119, C-120, C-121, C-129, and C-130.

The drawings from that donation are currently maintained at the UMASS Lowell Center for Lowell History. There they have been entered into a shelf list on standard library catalogue cards and will also be found in the LOWE Access database for the drawings collection. Indeed, the entries in that database were made from the Center for Lowell History's shelf list in order to create a single, comprehensive list for entire collection. The drawings at the UMASS Center for Lowell History are given a location designator in comprehensive database for the collection.

The upper vault index page also notes that shelf/folio C-122 "Locks & Canals Office Plans" is "Gone" and that shelf/folios C-123 and C-124, both holding "Old Land Plans", were "not indexed". In fact, these notations are accurate in that no C-122 drawings were found in the processing of this collection and that C-123 and C-124 drawings do not appear in either the Card Index File or the Consecutive Index of Drawings.

The drawings collection is, however, only one element in the larger PL&C archives. Other elements are its 1) Photographs collection, 2) Directors' Records, 3) General Files, 4) Deeds, 5) Flowage Records, 6) Tax Records, 7) Stock Records, 8) Physical Data of Canal Operations

Records, and 9) 355 volumes of management records including papers of the early principals of the company such as James B. Francis and Uriah Boyden, at the Baker Library, Harvard Business School.

The Photographs collection, like the drawings collection, is shared between Lowell National Historical Park, which holds the bulk of the historic prints, and UMASS Lowell Center for Lowell History, which holds the glass plate negatives and some historic prints. The photographs held by LOWE have been catalogued and are publicly accessible through the National Park Service web catalogue beginning with number LOWE-7001. The glass plate negatives held by UMASS Lowell Canter for Lowell History have been reproduced and printed and are publicly available there on-site. In addition, according to its inventory, Baker Library also holds a small number of photographs relating to canal construction.

The Directors' Records and General Files are held by Lowell National Historical Park under catalogue number LOWE-5058. They have been processed and have had a comprehensive finding aid produced for them. According to its inventory, Baker Library holds microfilm copies of the Directors' Records.

The Deeds, Flowage Records, Tax Records, Stock Records, and Physical Data of Canal Operations Records are also held by Lowell National Park under catalogue number LOWE-5058. They too have been processed and have had a comprehensive finding aid produced for them as well. Again, according to its inventory, Baker Library holds some of the types of records noted above as Physical data of Canal Operations such as Daybooks (1826-1831 and 1839-1845. LOWE holds six daybooks covering the period 1853 through 1883) or Computations on Northern Canal 1846-1848.

The large body of PL&C business records was donated to the Baker Library, Harvard Business School, in 1960 has been processed by them to the point where an inventory exists for their holdings.

The Collection as Administered by Lowell National Historical Park:

The Inventory Process:

Although Lowell National Historical Park only took formal title of all the drawings collections through purchase on October 24, 1996, its responsibilities to the Numbered sub-series, the Maps sub-series, and the Massachusetts Mills sub-series began with the signing of a Memorandum of Understanding of June 20, 1984, between the PL&C and LOWE regarding the disposition of the drawings. Thus, the National Park Service provided funding for professional conservation for the earliest of the Numbered sub-series of drawings covered by the terms of that agreement. This MOU also stipulated that a loan agreement would be arrived at between the two parties. This was effected in October, 1989, and it gave LOWE the right of first refusal in any future purchase of the collection. The loan agreement stipulated that LOWE would inventory the drawings collection.

At that point, the inventorying of the collections began in earnest. The LOWE Collection Manager developed a uniform manual inventory spreadsheet form and the process of entering drawings data onto that form began. The collection, as it was received in 1988, was accounted for on these forms, folio by folio, pigeon hole by pigeon hole, drawing by drawing. Thus, the manual inventory serves to document the "original" order of the collection as it was received by LOWE

from PL&C This is worthy of note here since the order in which those drawings were received was not the order in which PL&C intended them to be maintained according to its finding aids. In fact, the mildly chaotic order in which the drawings were received represented substantial disorder in terms of the organizational structure for them created by PL&C itself as shown in its finding aids. Returning the collection to the order intended for it by PL&C, then, would be part of the final product of the processing of the collection. The inventory process would also reveal the inclusion of the Maps and Massachusetts Mills drawings with the Numbered sub-series of drawings although they are not to be found in either the Card Index File or the Consecutive Index of Drawings.

In addition to acting as a record of the order in which the Numbered sub-series, the Maps sub-series, and the Massachusetts Mills sub-series collection was received, the manual spreadsheet inventory form was created with the ultimate objective in mind of generating an electronic database from it. It should be noted here that the Assets Division of Boott Mills drawings, the LIDC boiler sub-series drawings, and the Merrimack Valley sewers sub-series drawings were entered directly into their respective data files without being first entered first onto any manual inventory form. Advances in computer technology by 1997 had made a one step inventory process much more feasible that it had been in 1988 although the same basic data entry matrix, which reflected the old manual inventory form, was used for all of the component drawings sub-series.

That goal was accomplished and since the database incorporates both the LOWE portion of the Numbered drawings sub-series and the UMASS Lowell Center for Lowell History portion of the Numbered drawings sub-series as well as the other five drawings sub-series, and all of the information contained in both the PL&C generated Card Index File and Consecutive Index of Drawings and its Other Lists, it serves as the most complete and comprehensive access tool the total collection that currently exists.

The P. L.& C. Drawings Databases in Detail:

All six of the drawings databases are basically constructed in the same way as the original Numbered sub-series database is constructed. The data fields in order from left to right are as follows: Plan Number, Title, Date, Scale, Draftsman, Dimensions, Medium, Support, Type, Condition, Conserved, Notes, LC Topic, LC Index 1, LC Index 2, LC Index 3, Inventory Page Number, Location, Photo Negative, Photo Print, Photo Transparency. This is from the most fully developed example of a database record, namely, the Numbered sub-series of drawings.

Other sub-series may have fewer fields. If there would be no potential data for input into a particular field in a given sub-series, that field was not created for that sub-series' database. For example: the Assets division of Boott Mills sub-series, Lowell Industrial Development Company boiler sub-series, and the Massachusetts Mills sub-series do not have a Type field since there were no indexes or lists for these sub-series to compare the received body of drawings against. Again, most drawings sub-series do not have a Draftsman field since only historically significant draftsmen (e.g. James B. Francis, Uriah Boyden, etc.) were recorded in this field and the drawings in most of the sub-series were not produced directly by such individuals. Only one drawings sub-series uses a field unique to that sub-series, namely, the Assets Division of Boott Mills sub-series which uses a field titled Other Numbers. Most of the drawings in this sub-series are copies of drawings from other sub-series and, as copies, they bear the plan numbers of the originals from which they were made. Although those numbers were not applied by PL&C to

these drawings in this drawings sub-series, it proved useful to record them for cross-referencing purposes.

Data fields primarily used for drawings management purposes:

The fields Dimensions, Condition, Conserved, Inventory Page Number, Location, Photo Negative, Photo Print, and Photo Transparency are basically object management fields and do not contain information that really contributes to any genuine understanding of any of the drawings. The Dimensions are recorded for defining storage configuration needs; Condition is recorded to aid in defining potential conservation needs; Conserved defines whether, when, and by whom a plan has had professional conservation; Inventory Page Number is recorded in order to find the original manual inventory entry (there are 2426 pages in the manual inventory) in the event it has to be consulted; Location records a plan's current storage location which makes retrieval and refiling possible and also can be used for inventory control and management; the three Photo fields identify the location of any contemporary photographic copy of drawings regardless of format of why they were produced.

Data fields primarily used for description and understanding of the drawings:

The fields that are significant for understanding the drawings are Plan Number, Title, Date, Scale, Draftsman, Medium, Support, Type, Notes, LC Topic, LC Index 1, LC Index 2, and LC Index 3.

The Data Fields Described:

Plan number: The plan number is, of course, a fundamental element. Each drawing has to have a unique identifier and that identifier is the plan number. The individual numbering schemes for the various plans sub-series have been described above under P.L. & C. drawing sub-series numbering schemes and, thus, do not need to be repeated here. But it is necessary to define the use of square bracketing in the plan numbers as they appear in the databases because this bracketing was not developed by PL&C but, rather, represent LOWE inclusions.

Square brackets indicate elements in a plan number that came from some source other than PL&C

Because the database was prepared in Access, which does not support highlights such as Italics, or bolding, square brackets were the only device available to identify plan number elements that needed to be added by LOWE staff in order to provide a complete and unique drawing number and, thereby, properly incorporate plans left partially numbered or completely unnumbered by PL&C into the database. Most commonly, square brackets involve copy numbers added by LOWE to otherwise complete PL&C plan numbers, as found on the plans themselves or in the Card Index File or the Consecutive Index of Drawings (e.g. 131-001 and 131-001-[Copy 1]), where the number on the copy did not have such a suffix. This inclusion was necessary for database creation purposes but at the same time needed to be highlighted as not part of the original PL&C number as found.

In addition, wherever another plan number element was needed to make a complete number, square brackets were used in the same way, for example C-118-[345], where this drawing was found bearing the shelf/folio number C-118 without a plan number. In this case, LOWE added what would have been the next number added by PL&C if PL&C had numbered the drawing itself (C-118-344 having been the last actual number applied to a plan in this shelf/folio by PL&C).

There are other examples but they do not have to be explicated here since the general principle should be clear from the foregoing. Suffice it to say, again, that square brackets indicate elements in a plan number that came from some source other than PL&C

Title: The title is also a fundamental drawing element and titles were transcribed literally from their sources. Sources for titles are the drawings themselves, the Card Index File, the Consecutive Index of Drawings, the entries in the catalogue records created by the UMASS Lowell Center for Lowell History for the drawings it holds, and on very rare occasions, LOWE staff.

Since the titles were usually found on the drawings in title blocks, wherein they were arrayed in text lines broken to create an aesthetically appealing appearance, the line breaks created their draftsmen recorded, as found, in the title fields in the database by the use of slashes thus …(text) / (text)… in order to preserve the sense of the title as it appears on the drawing itself. This form of title entry also unexpectedly became helpful in determining the proper plan numbers for many titled but unnumbered drawings. This convention, however, applies only to titles found on actual drawings.

Whole titles taken from any source other than the drawings themselves are recorded in square brackets. This applies to all untitled plans that were otherwise identifiable and to all plans whose titles were transcribed from the catalogue card entries of the UMASS Lowell Center for Lowell History. If more than one external source was used to construct a title, each element is bracketed separately. For example, drawing C-121-2761 is in the collection of UMASS Lowell Center for Lowell History and was given by them the title "Proprietors of the Locks and Canals on the Merrimack River. Tube.", undoubtedly from the drawing itself. However, the title as shown in the database for drawing C-121-2761 reads "[Plans & Sections of Apparatus used in Experiments on Diffuser Pipes.] [Proprietors of the Locks and Canals on the Merrimack River. Tube.]". Thus the database uses both the UMASS Center for Lowell History transcribed drawing title and information from the PL&C Consecutive Index of Drawings to provide more complete title information while clearly indicating that two different external sources provided that information.

This convention also applies to title elements added by LOWE staff from the PL&C Card Index File, the Consecutive Index of Drawings, or any other outside source, to drawings that have titles but whose titles were excessively laconic or lacking in important specifics. The reasoning was that if PL&C itself enhanced its drawings titles with clarifying information in its own finding aids, such clarification should be respected by being incorporated into the LOWE database as well. For example, drawing C-126-3138 bears the title "Bridge over Pawtucket Canal, as Rebuilt in 1880" but the title as shown in the database reads "[Plan & Sections of Trussed Stringer of] Bridge over Pawtucket Canal, as Rebuilt in 1880" after the inclusion of further title information from the Consecutive Index of Drawings.

Lastly, it should be pointed out that title information in the database appears in full capital letters rather than mixed upper and lower case letters both for ease of reading and in order to avoid the idiosyncratic usages of case that appear on the plans themselves. The only exception is in the use Mc or Mac.

Date: A uniform convention was developed by LOWE for this data field irrespective of any date form that appeared on any drawing, any list or index, or on records received from UMASS Lowell Center for Lowell History. The date form applied consists of year/month/day, e.g. 1900/10/22. This conventional date form allows the entire database to be displayed in date order,

which was very helpful during the inventory and analysis phase of the processing of this collection. It also allows for very convenient searching of the database by date range, e.g. the month of March, 1922.

The only caveat here is that not every drawing bears a date. If the Card Index File or the Consecutive Index of Drawings were also lacking dates for drawings that did not bear them, there is no way of finding such drawings through searching the date field in the database. This is worth noting since about 20% of the drawings in the collection lack formal dates. However, less than half of these drawings are totally dateless. Of the 20% lacking formal dating, 60% have title or other information that would enable a user to place the drawing in either a span of time or infer a specific date. In such cases, the notations "SEE TITLE" or "SEE NOTES" appear in the date field and refer the user to the Title field or the Notes field of the database record where some type of date information (e.g. a dated watermark on the drawing paper) will be found. Those drawings that are truly dateless, under 10% of the total collection, bear the note "UNDATED" in the date field. The only other exceptions to the date field convention involve drawings with months or days of the month given but without a year, e.g. 0000/02/07. There only four such drawings in the total collection.

There are no blank date fields in the database as it would be self-defeating to create a field by which the database could be meaningfully ordered but create records for it that would be outside the scope of meaningful order. When the database is put in date order, Access places the numerical dates in order first, followed by the text entries in alphabetical order.

Scale: The drawing scale is usually entered in the database as it is found on the drawing. A surprising number of drawings did not bear formal scales. Unusual scales (e.g. Marquois scale) are entered in the Notes field with the reference "SEE NOTES" in the Scale field.

Draftsman: This field records only historically significant draftsmen. These include George R. Baldwin, John F. Baldwin, Kirk Boott, William Boott, Uriah A. Boyden, James B. Francis, Hiram Mills, Patrick Tracy Jackson, Benjamin Mather, and George Whistler. Only 150 the drawings in the Numbered plans sub-series were drawn by, or at least supervised by, these men and the majority of those drawings, 68 or 45%, were by James B. Francis. The names are into the field entered last name first in order that the field can be displayed in a useful alphabetical order.

The only two plans sub-series to employ the Draftsman field are the Numbered sub-series and the Maps sub-series and in the case of the Maps sub-series, which is largely published material, the "Draftsman" name is as often the name of publisher of the map as it is the individual who actually drew it (in many cases they were one in the same). However, it is still useful to have this information accessible in a discrete field where it is easily retrievable and able to be displayed in alphabetical order.

Medium: These drawings sub-series span a wide period of time and, because of this, the image rendering media employed in their creation are quite varied. They range from black ink, colored ink, water color, graphite and colored pencil, which were used commonly in all periods, to copying techniques used largely from the later 19th century to the 1980s.

Early 19th century copies were made by hand using the same media as the original drawings themselves. Another copy method was to use lithographed base-drawings and to add details to each copy by hand. By the 1880s blueprint copying processes were beginning to appear later to be followed by diazo process copying. Other forms of copy process were usually photographic in

nature with positive and negative images appearing on paper and on transparent supports, once chemically stable sheet-form substrates, such as acetate, began to appear in the 1930s. All of these processes are represented in the PL&C drawings collection.

Support: Because these drawings sub-series span a wide period of time there is a wide range of image supports, or substrates, to be found in the collection. It should also be noted that the drawings were produced in a wide range of sizes on the wood-pulp paper and drafting cloth supports probably because PL&C procured these supports in roll form and simply cut the stock to fit its perceived drawing size need. The cotton-rag paper and mylar or film supports were very likely produced in sheet form by their manufacturers which makes them more uniform in size, and often smaller, than the other supports. Sheet form supports also require the drawing on them to be fitted to the support rather than fitting the size of the support to the needs of the drawing.

Quite a number of drawings made between 1820 and 1863 are found on high quality cotton-rag English laid paper manufactured by J. Whatman, Turkey Mill, Kent. An American manufacturer of laid paper, J. Robeson of Philadelphia, is also found in drawings from the 1840s.

Sized cotton drafting cloth, sometimes referred to as "linen", was used by PL&C for drawings from 1834 to well into the 20th century. Together with the laid paper, drafting cloth represents the most durable of the supports.

The availability of low-cost wood-pulp papers following the Civil War caused such paper to be routinely used for drawings as well as a publishing and host of other purposes. Since its availability coincided with the era of cyanotype blueprint copying and preceded the era of diazo copying, copies from these drawings sub-series in these rendering media are on such paper and suffer accordingly.

A small group of sheet safety film negative copies was produced by PL&C in 1955 and a negative copy on sheet acetate of a 1923 graph was produced at an unknown date.

Drafting mylar was used to by PL&C produce a another small group of drawings in 1957. Both film and mylar were very minor supports in this collection largely because PL&C was in a state of contraction by the time that these supports were becoming significant in the realm of architectural and engineering drawing production.

Type: This field was developed during the processing of these drawings in order to provide a quick reference to their existential status. During the processing phase four categories were necessary to understand any given drawing's status.

They are:

> Type A. Drawings whose existence in known from either from the Card Index File or the Consecutive Index of Drawings or the unnumbered title lists for the Assets Division drawings, the Maps, and the Merrimack Valley sewer sewers project but which were not received by LOWE from PL&C
>
> Type B. Drawings whose existence was known from those indexes and lists and which were received by LOWE from PL&C

Type C. Drawings which were received by LOWE from PL&C but whose existence was not recorded in those indexes and lists as such.

Type D. Numbered sub-series drawings donated by PL&C to Lowell Textile Institute, now UMASS Lowell and its Center for Lowell History, prior to 1984.

Type A drawings were not received by either institution nor are they held by PL&C and are probably no longer extant. In fact, the fate of one group of type A plans (shelf/folio C-122 "Locks & Canals Office Plans") is stated on the Consecutive Index of Drawings upper vault index page as "Gone".

Since the completion of collection processing, the distinction between types B and C has basically become moot. In point of fact, both type B and type C drawings are owned by LOWE and the National Park Service. Type D plans continue to be owned by UMASS Lowell but this type designation applies only to Numbered sub-series drawings since PL&C did not donate any plans from the other five sub-series to Lowell Textile Institute or its successor.

Notes: The Notes field is the only field in the inventory designed to receive extraneous information. It was provided for the inclusion of information considered significant, or at least potentially significant, by staff processing the collection but which had no other logical place to be put in the inventory matrix. In practice, much of what appears in the Notes field does come from PL&C sources, such as notations appearing on the drawings or from the finding aids, but inventory staff could add observations of their own such as "This plan number was used twice by PL&C" to assure any user of the database that a duplicate plan number was, in fact, created by PL&C and was not the result of processing error.

Over time, the notations in this field have shown themselves to be very helpful in locating drawings and it is well worth searching the Notes field in addition to the Title field when using the database to do comprehensive searches.

Other numbers: This field applies only to the Assets Division of Boott Mills drawings sub-series and is not found in any other datasheet. Most of the drawings in this sub-series are copies of drawings from other sub-series and, as copies, they bear the plan numbers of the originals from which they were made. Although those numbers were not applied by PL&C to these drawings in this drawings sub-series, it proved useful to record them for cross-referencing purposes.

Locks and Canals topic: This field did not originally exist in the database but was added after the Consecutive Index of Drawings was found in the PL&C Files. It reflects the subject or topic covered by the individual folio/shelves or pigeon holes of Numbered sub-series drawings as defined by PL&C in that Consecutive Index. Like the Card Index File it employs a controlled indexing vocabulary but not the same one as the Card Index File and that is the key to its value since it provides yet another way or accessing or understanding the drawings. All drawings have Locks and Canals Topic indexing. Appendix 1 provides examples of the topic headings created by PL&C for the folio/shelves and pigeon holes.

Unlike the index headings used in the Card Index File, which apply to individual drawings, the topic headings from the Consecutive Index of Drawings apply to large groups of drawings and thereby act as categorical descriptors, as opposed to the discrete descriptors used by the card

index. As a searchable field, it provides one more avenue of approach to locating the drawings any given searcher might be attempting to find.

Historically, searching plan titles for key words was not a viable search strategy option. The computer has made that possible now and, thus, key-word-in-title searches would probably be the first choice of users today. Thus, these topic headings are not as crucial today as in the past but they can still be of great utility as long as the user has access to the controlled indexing vocabulary used to create them.

Basically this field was developed for the Numbered sub-series of drawings but it has been employed by LOWE for use with the Maps sub-series and the Assets sub-series as well since they also had their own broad categories applied to them in their PL&C finding aids.

Locks and Canals index 1: This is the primary level of indexing used in the Locks and Canals subject Card Index File. All drawings have indexing at this level and that includes Type C drawings, which were not located as such in the Card Index File. In many cases Type C drawings were copies whose originals were located in the card index but were not shown in the index in any copy form. This distinction was logical and helpful at the beginning of the inventory process prior to the advent of the consecutive index because PL&C often (but not always) noted on the index cards if a drawings were a BP (blueprint) or a TP (tracing paper, but often a misnomer for drafting cloth which is as efficient as tracing paper for making copies) drawing but was no longer really significant after completion of the inventory process. Because of this, PL&C card index information was added by LOWE staff based on the indexing for the original from which the copy was made or on the subject of the plan, if discernable, in order that all drawings be searchable at this primary subject level. In a few cases this was not possible and the note "Not Assigned by PL&C" was entered in order that the field not be left blank and give the impression of being an oversight.

Locks and Canals index 2: This is the secondary level of indexing used in the Locks and Canals subject Card Index File. Unlike level 1 indexing, which PL&C applied to every drawing, they applied this level of indexing only if they believed index level 1 subjects warranted further subject breakdown. In practice, the majority of index level 1 subject headings were not developed to the secondary level.

Locks and Canals index 3: This is the tertiary level of indexing used in the Locks and Canals subject Card Index File. Indexing to this level was only used with drawings relating to the textile manufacturing firms or Saco-Lowell Shops and, even then, many drawings relating to those entities did not require subject breakdown to a third level of specificity. It is clear from the database how many fewer drawings required subject indexing to this level than even to level 2.

Appendix 3 provides the hierarchical outline structure created by PL&C for the generation and maintenance of the Card Index File and shows all of the subject headings employed by PL&C This index and the fields it uses in the database apply only to the Numbered sub-series of drawings since, unlike the Consecutive Index of Drawings, the other sub-series have no analog to the Card Index File.

Searching the Databases:

The database format for each sub-series of drawings is basically the same structure with more or fewer fields depending on the data provided by or about each sub-series. The first and the fullest manifestation of a database is that for the Numbered sub-series of drawings. The others contain either the same number or fewer fields than the Numbered sub-series database. The only exception to this general rule is the Other Numbers field in the Assets Division of Boott Mills drawings database, which is unique and whose function is described above.

Since the datasheet for each sub-series uses the same basic matrix, they are easily comprehended when moving from one drawing sub-series to the next. In addition, they all function the same way. For example, any datafield in any drawings sub-series can be searched for any specific search term for that entire drawings sub-series. Simply highlight the datafield, in column, and click on the binoculars icon in the Access toolbar. When the “Find and Replace” window pops up, enter your search term but be certain to select “Any part of Field” in the “Match” block rather than “Whole Field”. Traditionally this feature is most often used for Title and Notes field searches since they are the largest narrative fields and contain the type of data most amenable to word searches. But any field can be searched in this way. The other choices in the “Match” block are not as useful as “Any part of Field” for general searching.

Another helpful function is the ability to arrange any datafield in alphabetical or numerical order for an entire drawings sub-series. Again, simply highlight the datafield, in column, and click on the binoculars icon in the Access toolbar. When the “Find and Replace” window pops up, enter your search term but be certain to select “Any part of Field” in the “Match” block rather than “Whole Field”. This feature is particularly useful with the Plan Number field, the Date field, the Type field, the Locks and Canals Topic field, the three Locks and Canals Index fields, and the Location field.

This ability permits the use of the Location field as an inventory control field by identifying drawings as well simply a drawing locator field. For example, used this way the drawings can be arranged in folder number (created by LOWE) order within shelf/folio (created by PL&C) The only drawback is that the drawings within that field order do not display in plan number order but entry order. However, this is only a minor inconvenience.

For the other fields, arranging the data in hierarchical order by that field enables one to 1) keep the drawings sub-series data in plan number order or return them to that order as the basic order, 2) arrange the sub-series data in date order to easily survey plans grouped by year, and within year, by month and day, 3) easily survey the entire sub-series by holder and group all Type A (not received) plans together, 4) arrange and search the drawings by their PL&C Topic headings (if they apply to the sub-series one is searching), and 5) arrange and search the Numbered sub-series drawings in PL&C Card Index File headings. As with the arranging the database in the Location field order, the drawings within that field order do not display in plan number order but entry order.

Proprietors of the Locks and Canals

Architectural and Engineering Drawings

Appendix 1

Consecutive Index of Drawings Belonging to Proprietors of the Locks and Canals on the Merrimack River: Cover sheet, Upper Vault (C- prefix) and Lower Vault summary sheets, and example of first sheet of detailed C- prefix (Upper Vault) drawings list. Because this index is both incomplete and 330 pages in length, it is not appended in full. The C- prefix detailed sheet is included to illustrate how that prefix's function was discovered given the fact that the Upper Vault summary sheet created by P.L.& C inexplicably does not show the C- prefix. This index was created by the Proprietors of the Locks and Canals.

PIGEON HOLES - UPPER VAULT

-.oOo.-

P.H.
No. C-

1. Diagrams showing Heights of River at Lake Winnipiseogee, Plymouth, Sewell's Falls, Garvins' Falls, Manchester, Nashua, and Lowell from 1895 to 1904.

2. Plan of Merrimack River between School and Moody Streets showing contours of Falls Field on North Bank.

3. Plan and Sections of Bed of Upper Portion of Hunts Falls. 1871.

4. Post Map of Pennsylvania, New Jersey, Maryland, Deleware, with adjacent territory of New York, Ohio, Virginia and West Virginia. 1869. 6m.=1"

5. Plan of Land in Lowell and Dracut (Now Centerville) West of Bridge St. 1856.

6. Plan of Chelmsford (Now Lowell) as surveyed by Jas. Baldwin in 1825 for the Merrimack Mfg. Co and recorded in the Register of Deeds Office in Middlesex County. 1874.

7. Old Factory Mutual Mill Yard Plans.

8. Plan of part of the Northern Canal Gate House showing Hoisting Wheel with Waterways to and from same. March 1902.

9. Plan of Pawtucket Canal from School Street Bridge to Central Street Bridge showing adjacent land and streets. Large Size. 1898.

10. Profile of Merrimack and Nashua Rivers from Lowell to Nashua by U.A. Boyden, (4 drawings) 1836.
Profile showing falls or slopes between different stations and the whole fall from Jackson's Factory on the Nashua River to the Lowell Dam on the Merrimack River from June 20 to July 18, 1834, inclusive. by L. Baldwin Eng. (Orig. Tracing and Blue Print)

11. Old Plans (6) pertaining to the Boott Penstock as built in 1873, and to the Extension built in 1889.

12. Old Pland pertaining to the construction of the Hamilton Wasteway 1882-84.

13. Plan of Northern Canal and Merrimack River from above Dam to below Moody St by Chas F. Reed. 1848.
Plan of Merrimack River (in 3 parts) from Bever Brook to Mouth of Concord. Large Scale. 1881.

14. Profile of Merrimack River by Gen. Thom, U.S. Engr. Corps., from Newburyport to Manchester, N. H. showing bench gauges, etc. and obstructions to navigation from Head of Mitchell's Falls below Lawrence to Manchester. Scale 1:100 (elevation) 1881.
Profile and Plan of Hunts Falls, by Gen. Thom U.S.Eng. Corps. showing soundings and proposed cuts to made a 4' channel for navigation. Scale 1:2000. 1881.

15. Plan of Land on the Northerly side of Merrimack River in Lowell and Dracut. 1875.
Plan and profile of Merrimack from Hunts Falls to Mitchells Falls based upon proposed canal surveys.. January 1844.

Appendix 2

Proprietors of the Locks and Canals Architectural and Engineering Drawings Collection:
Numbered Drawings Sub-series Topic Headings

This list was created by LNHP staff to supplement the Consecutive Index of Drawings Upper and Lower Vault summary sheets by providing a current and complete list of the folio/shelf and pigeon hole topic headings. This was necessary because those summary sheets, as created by P.L.& C., are incomplete in this respect due to the fact that they had not been properly updated by them. Thus, this list provides the necessary indexing vocabulary for searching the LCTOPIC field in the database.

These topic headings were taken from the individual shelf/folio and pigeon hole lists generated by P.L.& C. as constituent parts of the Consecutive Index of Drawings. They represent a more complete list than sum of those headings found on the Upper Vault and Lower Vault summary sheets alone because those summaries were properly not updated by P. L.& C. This list is meant to supplement those vault summary sheets, which are also part of this Appendix, in order to provide a complete list topic headings for database users wishing to search the database field LCTOPIC in the Numbered sub-series of drawings.

Outline of Locks & Canals Card Index File. This index was created by the Proprietors of the Locks and Canals and appears to be complete. The two- and three-level indexing structure created by P.L.& C. for some subject headings is clearly illustrated in this outline. This list provides the necessary indexing vocabulary for searching the LCINDEX 1, LCINDEX 2, and LCINDEX 3 fields in the database.

OUTLINE OF LOCKS & CANALS CARD INDEX FILE

This outline differs from that generated by Locks & Canals in three particulars. First, it accurately reflects the guide cards as they appear in the card index itself rather than the subject headings as they appear in the old outline. This eliminates the inconsistencies, anomalies and contradictions that grew up over the years between Locks & Canals' philosphy, as reflected in the outline, and practice, as reflected in the index card file. Secondly, the cross-referenced subject headings incorporated into the original outline have been dropped from this outline and printed separately. Those cross references (except for Brewery, Fletcher Street and High Bridge under Bridges - Locks & Canals) were not represented by guide cards in the card index itself and, thus, were outside the scope of this index. Thirdly, the guide card colors are now buff and blue. Salmon pink was no longer available in the 4 x 6 size and thus could not be used in restoring the Locks & Canals card index. All primary subject headings at the left margin have buff guide cards, secondary subject headings at the first indention have blue guide cards. No tertiary subject headings at the third indention have guide cards, which parallels Locks & Canals' practice.

Appendix 5

Assets Division of Boott Mills plans case drawer lists.
These abbreviated drawings titles lists were created by the Proprietors of the Locks and Canals. One copy of each list was found in the drawer with the plans to which it pertained. Neither the drawers nor the lists were numbered. The list headers were use by LNHP staff in creating the database for these drawings in the same way as the list headers in the Consecutive Index of Drawings were used for the Numbered sub-series of drawings, that is, to provide the necessary indexing vocabulary for searching the LCTOPIC field in the database.

Plan showing L & C Reservoir 1907 & 1912.
Plan showing Contours of L & C Reservoir Lot
RIVER BARGE - STEEL (2 SHEETS)

Proprietors of the Locks and Canals

on Merrimack River

Architectural and Engineering Drawings

Finding Aid

Appendix 6

Map list. This list was created, classified, and numbered by the Proprietors of the Locks and Canals. The group headers were use by LNHP staff in creating the database for these drawings in the same way as the list headers in the Consecutive Index of Drawings were used for the Numbered sub-series of drawings, that is, to provide the necessary indexing vocabulary for searching the LCTOPIC field in the database.

Lowell Maps.

1. Old plan of Lowell. No date or author given.
2. Plan of Sundry Farms at Patucket in the town of Chelmsford, by J.G.Hales,-1821.
*3. Same as 2, (to be framed).
*4. Plan of land and buildings belonging to the Merrimack Mfg. Co., with neighboring farms and roads, at Patucket, in town of Chelmsford, by G.R.Baldwin,-1825. (to be framed).
5. Plan of buildings and land belonging to the Merrimack and Hamilton Mfg. Cos. and the Locks and Canals in towns of Lowell and Dracut, by J.C.Hales,-1827.
*6. Plan of town of Lowell and Belvidere Village, from measurements taken by Benj. Mather,-1832, (to be framed).
7. Plan of part of Lowell, from a survey made by U.A.Boyden in 1833-4, with additions by J.B.Francis,-1837.
*8. Map of city of Lowell, surveyed in 1841, by I.A.Beard and J.Hoar, (to be framed).
*9. Same as 8, but showing banks belonging to Locks and Canals, (to be framed).
10. Same as 8, but showing pipe lines.
11. Plan of land in Lowell belonging to Locks and Canals, by J.B.Francis,-1844.
*12. Plan of city of Lowell from actual surveys by Sidney and Neff,-1850, (to be framed).
*13. Map of city of Lowell, by R.W.Baker,-1868, (to be framed).
14. Same as 13, but showing pipe lines.
15. Same as 13, but with red lines for purposes unknown.
16. Same as 13, but showing city water pipes.
17. Index map of Lowell, by Rippley,-1888.

Massachusetts State Maps.

41. Topographical map of Mass. from surveys by Simeon Borden.
42. Topographical map of Mass. from astronomical, trigonometrical, and various local surveys, - 1844.

Boston Maps.

43. Plan of Boston and vicinity, showing drainage area of Stony Brook, from surveys by H.M. Wightman. (no date given).
44. Plan of lands on Back Bay, showing Streets, Grades, and Sewers, with portions of adjacent territory in Boston, Roxbury, and Brookline, by Jas. Slade, - Dec. 31, 1861.
45. Same map as 44, but drawn by H.M. Wightman, Feb. 20, 1863.
46. Same map as 44, but drawn by H.M. Wightman, Dec. 6, 1864.

Other Maps.

47. Map of city of Lawrence, by J.H. Barker, - 1853.
48. Illustrated map of the World on Mercator's Projection, by D.G. Johson, - 1852.
49. Post Route map of New York, and parts of Vt., Mass., Conn., N.J., and Pa., also adjacent portions of Canada, by W.L. Nicholson, - 1868.
*50. Map of Middlesex County, (Mass.), by H.F. Walling, - 1856, (to be framed)
*51. Railroad and township map of New England, with portions of New York and Provinces, by G.W. Colton - 1855, (to be framed).
52. Centennial Postal Statistical map of Mass., R.I., and Conn., showing railroads, post-routes, and post-offices; also population of cities and towns, by M.G. Cook and Frank O. Ellis, - 1876.
53. Map of the World, - Rand-McNally.
54. Map of New England, - Geo. H. Walker, - 1905.

New Hampshire State Maps.

18 Map of N.H. from surveys made by "supreme authority," about 1830.
19. Map of mountain and lake regions of N.H. with railroad routes, by M. Conant, - 1852.
20. Township and railroad map of N.H. from actual surveys, - 1854.
21. Same.
*22. Map of N.H. from latest official surveys and records, - 1878. (to be framed).
*23. Same. (to be framed).

New Hampshire County and City Maps. Also Winnipisseogee Lake.

24. Map of Strafford County, by J. Chace, Jr., - 1856.
25. Map of Lake Winnipisseogee, Long Bay, and Smith's Pond, - 1858, by W.P. Crocker, copied by W.C. Pickersgill.
26. Map of Merrimack County, from surveys under direction of H.F. Walling, - 1858.
27. Map of Cheshire County, from surveys by L. Fagan, - 1858.
28. Map of Hillsboro County, from surveys by J. Chace, - 1858.
29. Topographical map of Carroll County, from surveys by H.F. Walling, - 1860.
30. Topographical map of Sullivan County, from surveys by H.F. Walling, - 1860.
31. Map of Rockingham County, from surveys by J. Chace, Jr., - 1860.
32. Topographical map of Grafton County, from surveys by H.F. Walling, - 1860.
33. Map of Belknap County, from surveys by E.M. Woodford, - 1869.
34. Map of city of Manchester, by J.A. Weston, - 1870.

United States Maps.

35. Map of U.S., Provinces, Mexico, West Indies, by J.H. Colton, - 1851.
36. Map of U.S., by A. Petermann, - 1874.
37. Map of U.S. and territories with details, compiled under direction of Hon. S.S. Burdett, - 1874.
38. Map of U.S. and territories with adjacent parts of Canada and Mexico, and parts of West Indies, with details, from official surveys of the General Land Office and other authentic sources, drawn by G.P. Strum, - 1885.
39. Map of U.S. and territories with adjacent parts of Canada and Mexico, also part of West Indies, with details, by Harry King, C.E., - 1894.
40. Map of U.S., issued by the Chicago, Burlington, and Quincy R.R.

May 19, 1919

When a red star (*) appears after the note
"No Negative" it means that the negative
was found after the index was made up.
